

Supplementary Figure 3. Relative contribution of different disease states to VL transmission over time during the WHO-recommended interventions for all four models. In models E0 and W0 (left), only symptomatic individuals contribute to transmission. In models E1 and W1 (right), asymptomatic individuals are the main contributors to transmission. All graphs are for a 10/10,000/yr pre-control endemicity setting with a 5-year attack phase followed by the consolidation phase.
