

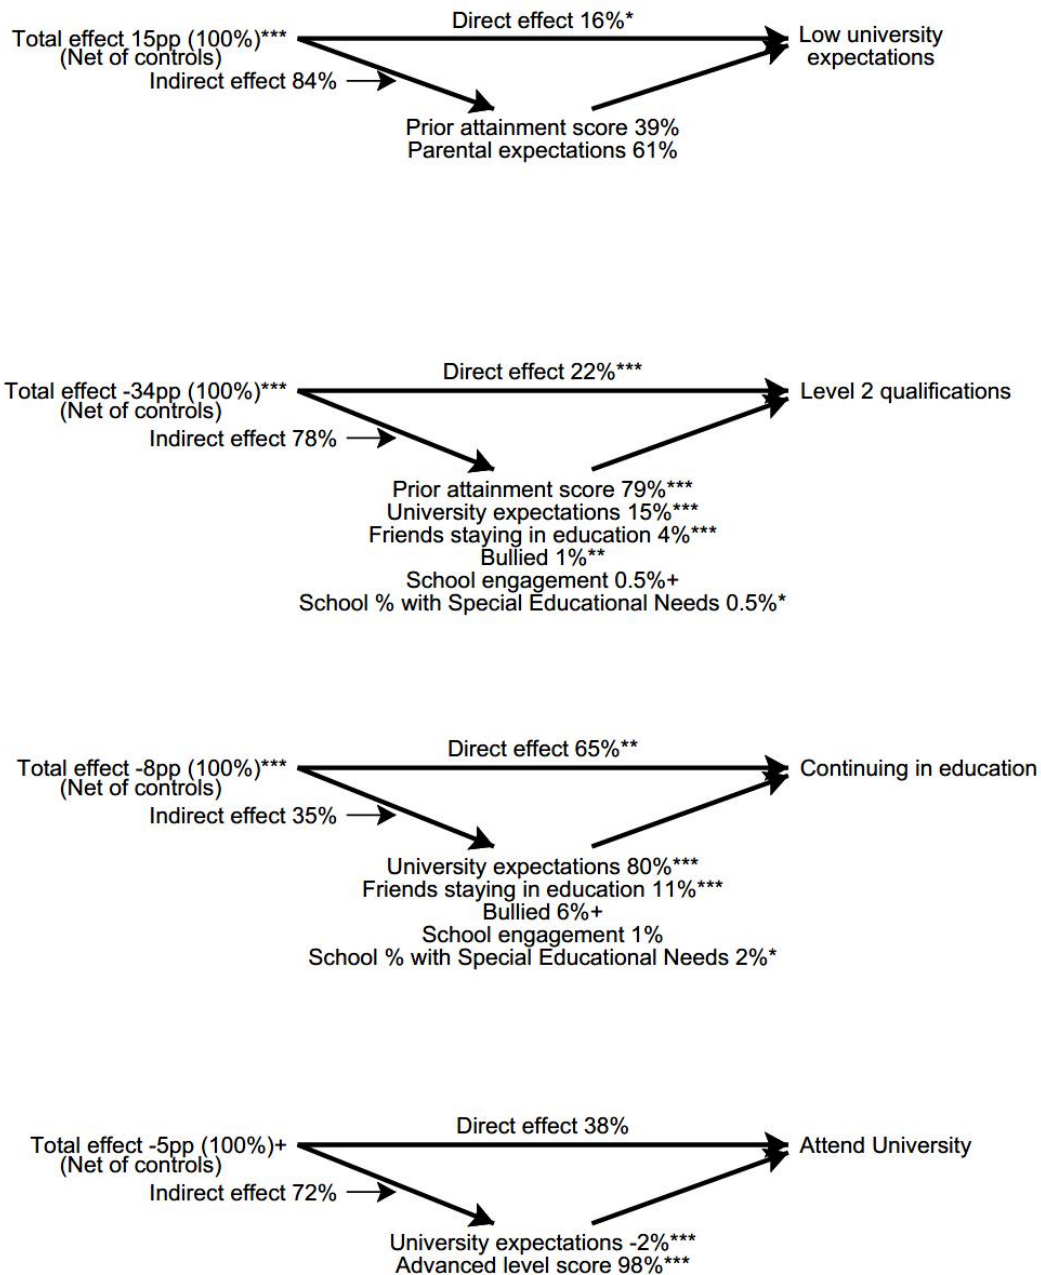

Figure I: KHB decompositions of direct and indirect effects

KHB Decompositions of Direct and Indirect Effects

Note: Total effects take the value after adjusting for controls (child sex, ethnic group, and parental education), to allow them to be split between the direct effect of disability and the posited mediators. The statistical significance of the total effect and the direct effect is indicated in the figures: + p<0.1; *p<0.05, **p<0.01; ***p<0.001. No symbol indicates the effect is not statistically significant at these levels.
