# The Jocic Reaction and the Synthesis of 

## Vitamin E

## by

James Tomlinson

A thesis submitted in partial fulfilment of the requirements for the degree of Doctor of Philosophy in Chemistry

## Table of Contents

Table of Contents ..... 2
List of Figures ..... 6
List of Schemes ..... 9
List of Tables ..... 19
Acknowledgements ..... 23
Declaration ..... 24
Abstract ..... 25
Abbreviations ..... 26
Chapter 1: Introduction to Vitamin E and the Jocic Reaction
................................................................................................... 28 ..... 28
1.1 Discovery of Vitamin E ..... 28
1.2 Mechanism of Action ..... 30
1.3 Influence of Substituents on Activity ..... 31
1.4 Comparison Between $\alpha$-, $\boldsymbol{\beta}$-, $\gamma$ - and $\boldsymbol{\delta}$ - forms ..... 38
1.4.1 In Vitro ..... 38
1.4.2 In Vivo ..... 38
1.5 Vitamin E Deficiency in Humans ..... 41
1.6 Potential Non-antioxidant Applications ..... 42
1.7 Tocotrienols ..... 43
1.8 Vitamin E Synthesis in Industry ..... 44
$1.9 \boldsymbol{\alpha}$-Tocopherol Asymmetric Total Synthesis ..... 48
1.9.1 C1' $\mathbf{C}_{2}{ }^{\prime}$ Coupling Approach ..... 48
1.9.2 Other Approaches to Enantiomerically Enriched Chromanes. ..... 52
1.9.3 Stereospecific Ring Closure Approach ..... 56
1.9.4 Stereoselective Ring Closure Approach ..... 62
1.10 Our Planned Synthesis of $\boldsymbol{\alpha}$-Tocopherol ..... 69
1.11 The Jocic Reaction ..... 70
1.12 The Bargellini Reaction ..... 71
1.13 Synthesis of Racemic Trichlorocarbinols ..... 72
1.13.1 Trichloromethyl Anion Addition ..... 72
1.13.2 Nucleophilic Addition to Chloral. ..... 83
1.14 Synthesis of Enantiomerically Enriched Trichlorocarbinols ..... 88
1.14.1 Asymmetric Reduction ..... 90
1.14.2 Organocatalysis ..... 92
1.15 Jocic Reactions with Racemic Trichlorocarbinols ..... 98
1.15.1 Reactions with Oxygen-based Nucleophiles ..... 98
1.15.2 Reactions with Nitrogen-based Nucleophiles ..... 102
1.15.3 Reactions with Sulfur-based Nucleophiles ..... 103
1.15.4 Reactions with Halide Nucleophiles ..... 104
1.15.5 Reactions with Hydride Nucelophiles ..... 106
1.16 Jocic Reactions with Enantiomerically Enriched Trichlorocarbinols
107
1.16.1 Reactions with Oxygen-Based Nucleophiles ..... 107
1.16.2 Reactions with Nitrogen-Based Nucleophiles ..... 109
1.16.3 Reactions with Other Nucleophiles ..... 115
1.17 Bargellini Reactions ..... 115
Chapter 2: The Total Synthesis of Vitamin E ..... 118
2.1 Synthesis of Model Compounds ..... 118
2.2 Synthesis of Aldehyde 35 ..... 129
2.3 Completion of the $\alpha$-Tocopherol Synthesis ..... 134
2.4 Trolox ..... 136
2.5 Revised Preparation of Methyl Ester 387 ..... 137
2.6 Synthesis of $\gamma$-Tocopherol ..... 138
2.6.1 Previous Literature Syntheses ..... 138
2.6.2 Our Total Synthesis ..... 141
2.7 Other Tertiary Trichlorocarbinol Substrates ..... 144
2.7.1 Reactions with Carbon Nucleophiles ..... 144
2.7.2 Reactions with Nitrogen Nucleophiles ..... 153
2.7.3 Reactions with Oxygen Nucleophiles ..... 155
2.8 Conclusions and Future Work ..... 157
2.9 Experimental Section ..... 159
Chapter 3 ..... 213
3.1 (R)-4-(Trichloromethyl)-oxetanone 254a ..... 213
3.2 The Synthesis of ( $\boldsymbol{R}$ )-dihydrocitronellol ..... 215
3.3 Scope of the Reductive Jocic Reaction ..... 226
3.3.1 The Synthesis of Tertiary Trichlorocarbinols ..... 226
3.3.2 Jocic Reation using Hydride Nucleophile ..... 229
3.4 Dichlorocarbinols as Alternative Substrates ..... 232
3.4.1 Literature Syntheses and Reactions of Dichlorocarbinols ..... 232
3.4.2 Synthesis of Dichlorocarbinol Substrates ..... 238
3.4.3 Jocic Reaction using Hydride Nucleophile ..... 242
3.4.4 Results ..... 242
3.4.5 Mechanism Considerations ..... 244
3.4.6 Stereochemistry ..... 248
3.5 Other Nucleophiles ..... 252
3.6 Conclusions and Future Work ..... 254
3.7 Experimental Section ..... 256
References ..... 299

## List of Figures

Figure 1. Naturally occurring vitamin E compounds............................................... 29
Figure 2. Newman projection of 4-methoxy-2,3,5,6-tetramethyl phenoxyl radical. 34
Figure 3. Newman projection of pentamethyl-6-hydroxy chromanoxyl radical....... 34
Figure 4. Presumed conformation of compound $\mathbf{1 5 h}$, with the nitrogen lone pair perpendicular to the $\pi$ system................................................................................... 35

Figure 5. A selection of target compounds which use a Bargellini reaction to install the $\alpha$-disubstituted carboxylic acid motif. 116

Figure 6. Top: HPLC trace of $( \pm)-373$. Bottom: HPLC trace of $(R)-373$. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=90: 10,1 \mathrm{~mL} / \mathrm{min}, 221 \mathrm{~nm},(R)$ isomer $14.81 \mathrm{~min},(S)$ isomer 16.33 min . 128

Figure 7. Top: HPLC trace of $( \pm)-\mathbf{3 8 2}$. Bottom: HPLC trace of ( $S$ )-382. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=90: 10,1 \mathrm{~mL} / \mathrm{min}, 220 \mathrm{~nm},(R)$ isomer $14.35 \mathrm{~min},(S)$ isomer 16.12 min . 128

Figure 8. Top ${ }^{1} \mathrm{H}$ NMR spectrum: $(R)$-lactone 171. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: compound 366 . 130

Figure 9. Top: HPLC trace of ( $\pm$ )-366. Bottom: HPLC trace of $(R)$ - $\mathbf{3 6 6}$ Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=95: 5,1 \mathrm{~mL} / \mathrm{min}, 214 \mathrm{~nm},(R)$ isomer $7.67 \mathrm{~min},(S)$ isomer 8.65 min . 132

Figure 10. Top: HPLC trace of ( $\pm$ )-387. Bottom: HPLC trace of ( $S$ )-387. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=95: 5,1 \mathrm{~mL} / \mathrm{min}, 221 \mathrm{~nm},(S)$ isomer $29.05 \mathrm{~min},(R)$ isomer 31.92 min . 132

Figure 11. Top ${ }^{1} \mathrm{H}$ NMR spectrum: synthesised $\alpha$-tocopherol 1. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: authentic sample purchased from TCI (UK).............................................. 1

Figure 12. Top ${ }^{13} \mathrm{C}$ spectrum: Synthesised $\alpha$-tocopherol 1. Bottom ${ }^{13} \mathrm{C}$ spectrum: authentic sample purchased from TCI (UK)........................................................... 135

Figure 13. Top: HPLC trace of $( \pm)$-367. Bottom: HPLC trace of $(R)$-367. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=4: 96,1 \mathrm{~mL} / \mathrm{min}, 227 \mathrm{~nm},(S)$ isomer $18.55 \mathrm{~min},(R)$ isomer 19.88 min 143

Figure 14. Top: HPLC trace of $( \pm)$-411. Bottom: HPLC trace of ( $S$ )-411. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=6: 94,1 \mathrm{~mL} / \mathrm{min}, 231 \mathrm{~nm},(S)$ isomer $19.64 \mathrm{~min},(R)$ isomer 22.59 min . 143

Figure 15. Top ${ }^{1} \mathrm{H}$ NMR spectrum: isolated single diastereoisomer of compound 434. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: crude reaction mixture. Inset: diastereomeric CHCl doublets. 148

Figure 16. ${ }^{1} \mathrm{H}$ NMR spectrum of isolated lactone 435. .......................................... 149
Figure 17. ${ }^{1} \mathrm{H}$ NMR of isolated side product 439................................................... 152
Figure 18. Comparison of IR data to the literature. ............................................... 155
Figure 19. ${ }^{1} \mathrm{H}$ NMR of crude reaction mixture. Inset: magnified region showing $\alpha-\mathrm{CH}$
$\qquad$
Figure 20. HPLC trace of ( $\mathbf{\pm}$ )-482. ...................................................................... 221
Figure 21. HPLC trace of $(R)$ - 482. Conditions: Daicel Chiralcel AD-H column, 2propanol : hexane $=98: 2,1 \mathrm{~mL} / \mathrm{min}, 225 \mathrm{~nm},(S)$ isomer $32.49 \mathrm{~min},(R)$-isomer 36.84 min. 221

Figure 22. HPLC trace of the phosphonate ester ( $\pm$ )-482. 224

Figure 23. HPLC trace of the phosphonate ester $(S)-482\left(0^{\circ} \mathrm{C}\right.$ reaction temperature).

Figure 24. HPLC trace of the phosphonate ester ( $S$ )-482 (room temperature reaction). Conditions: Daicel Chiracel AD-H column, 2-propanol : hexane $98: 2,1 \mathrm{~mL} / \mathrm{min}, 225$

Figure 25. Synthesis of tertiary trichlorocarbinols. ${ }^{\text {a }}$ This compound was synthesised using the method of Aggarwal et al.: $\mathrm{CHCl}_{3}$ (2.0 equiv.), DBU (1.0 equiv.), rt, 16 h .

Figure 26. Top: ${ }^{1} \mathrm{H}$ NMR spectrum of entry a crude mixture. Bottom: ${ }^{1} \mathrm{H}$ NMR spectrum of entry $\mathbf{h}$ crude mixture......................................................................... 231

Figure 27. Synthesis of dichlorocarbinols. Reagents and conditions: LDA (2.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}, 0.5 \mathrm{~h}$. Yields shown for 542i-k and 542n are the combined yield of both diastereoisomers. ${ }^{\text {a }}$ Crude yield. 239

Figure 28. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of 542i. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio. ........................................................ 240 Figure 29. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2} \mathbf{j}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio. ........................................................ 241

Figure 30. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2 k}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio. ........................................................ 241

Figure 31. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2 n}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to measure diastereomeric ratio ............................................................ 242

Figure 32. Top ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the crude mixture of 543b. Bottom
$\qquad$
Figure 33. Illustration of possible transition states in the ring opening of gemdichloroepoxides. ................................................................................................... 246

Figure 34. Top ${ }^{1} \mathrm{H}$ NMR spectrum: crude reaction mixture of $\mathbf{5 4 3}$. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: tertiary alcohol 549.................................................................................... 1

Figure 35. ${ }^{1} \mathrm{H}$ NMR spectra from top to bottom: starting material epoxide 550; tertiary alcohol 549; primary alcohol 543c; crude reaction mixture of epoxide $\mathbf{5 5 0}$ subjected to our Jocic reduction conditions. ............................................................................... 1

Figure 36. Top ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of a mixture of both 542i diastereoisomers. Middle ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of the more polar diastereoisomer of 542i. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of the less polar diastereoisomer of 542i....................................................... 1

Figure 37. Magnification of $\alpha$-CH peaks. .............................................................. 249
Figure 38. ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture from the Jocic reaction of dichlorocarbinol 542k. ........................................................................................... 251

Figure 39. ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture from the Jocic reaction with dichlorocarbinol 542j. Inset: $\mathrm{CH}_{3} \mathrm{CH}$ doublets used to determine the diastereomeric ratio

## List of Schemes

Scheme 1. Lipid autoxidation free radical chain reaction. ....................................... 30
Scheme 2. Inhibition of free radical propagation by tocopherols.............................. 31
Scheme 3. Reactions of $\alpha$-tocopherol with peroxyl radicals. .................................... 31
Scheme 4. Stabilisation of phenoxyl radicals by delocalisation............................... 33
Scheme 5. Regeneration of tocopherol by $\mathrm{UQ}_{10} \mathrm{H}_{2}$ (Ubiquinol-10). ......................... 37
Scheme 6. Pathway of metabolism of $\gamma$-tocopherol to its $\gamma$-CEHC form.................. 40
Scheme 7. Proposed mechanism for the trapping of $\mathrm{NO}_{2}$ radicals by $\gamma$-tocopherol.. 41
Scheme 8. First reported synthesis of $\alpha$-tocopherol. ................................................ 44
Scheme 9. Industrial synthesis of (all-rac)- $\alpha$-tocopherol 28 and its acetate 29. ....... 45
Scheme 10. Industrial synthesis of (all-rac)-isophytol 27........................................ 45
Scheme 11. Representative procedure for the upgrading of $\gamma$-tocopherol to $\alpha$ -
$\qquad$
Scheme 12. Asymmetric hydrogenation of olefins using Ru and Ir catalysts........... 47
Scheme 13. $\mathrm{C}_{1}$ '- $\mathrm{C}_{2}$ ' coupling route towards $\alpha$-tocopherol. ..... 48
Scheme 14. Kinetic resolution of racemic aldehyde ( $\pm$ )-36. ..... 49
Scheme 15. Synthesis of aldehyde 46 by chiral resolution. ..... 50
Scheme 16. Synthesis of ( $3 R, 7 R$ )-1-bromo-3,7,11-trimethyldodecane 56. Some steps have been omitted for clarity. ..... 50
Scheme 17. Synthesis of (S)-chroman-2-methanol 61 ..... 51
Scheme 18. Synthesis of $\alpha$-tocopheryl acetate. ..... 52
Scheme 19. Synthesis of chromane aldehyde 35 via an enantiomerically enriched sulfoxide ..... 53
Scheme 20. Asymmetric Wacker-type cyclisation. ..... 54
Scheme 21. Chromane synthesis using an asymmetric $O$-alkylation. ..... 55
Scheme 22. Intramolecular $O$-alkylation. ..... 55
Scheme 23. Synthesis of chromanes using a Sharpless dihydroxylation. ..... 56
Scheme 24. o-Alkylation of phenols with dialkyl sulphides. ..... 57
Scheme 25. Total synthesis of $\alpha$-tocopherol 1. ..... 58
Scheme 26. Synthesis of known benzoquinone intermediate 108 ..... 58
Scheme 27. Synthesis of $\alpha$-tocopherol 1 by Hübscher and Barner. ..... 59
Scheme 28. Synthesis of $\alpha$-tocopherol using a stereoselective Shi epoxidation. ..... 60
Scheme 29. $\alpha$-Tocopherol synthesis using a directed cuprate addition. ..... 61
Scheme 30. $\alpha$-Tocopherol synthesis using a Mitsunobu reaction. ..... 62
Scheme 31. Synthesis of chromanes via palladium-catalysed cyclisation. ..... 63
Scheme 32. Domino Wacker-type oxidation and Heck reaction. ..... 63
Scheme 33. Synthesis of $\alpha$-tocopherol using a domino aldol/Michael addition. ..... 64
Scheme 34. Proposed mechanism for the aldol/oxa-Michael addition. ..... 65
Scheme 35. Biomimetic synthesis of $\alpha$-tocopherol 1. ..... 66
Scheme 36. Reaction mechanism of tocopherol cyclase. ${ }^{213}$ ..... 66
Scheme 37. Synthesis of $\alpha$-tocopherol by 1,4-addition. ..... 67
Scheme 38. Stereoselective synthesis of a chromane compound ..... 68
Scheme 39. Sulfoxide-directed allylation. ..... 69
Scheme 40. Preliminary retrosynthesis of $\alpha$-tocopherol 1 ..... 69
Scheme 41. The Jocic reaction. ..... 70
Scheme 42. General mechanism for the Jocic reaction. ..... 70
Scheme 43. General mechanism for the Bargellini reaction. $\mathrm{R}^{1}, \mathrm{R}^{2}=$ alkyl. ..... 71
Scheme 44. Failure of aldehydes as substrates in the Bargellini reaction. $\mathrm{R}^{1}=$ alkyl.71
Scheme 45. Early synthesis of 1,1,1-trichloro-2-methylpropan-2-ol. Yield not reported. ..... 72
Scheme 46. Synthesis of 2,2,2-trichloro-1-phenylethan-1-ol by Jocic. ..... 73
Scheme 47. Synthesis of 2,2,2-trichloro-1-(furan-2-yl)ethan-1-ol. ..... 73
Scheme 48. Attempted synthesis of aliphatic trichlorocarbinols. $\mathrm{R}=\mathrm{CH}_{3} \mathrm{CH}_{2}$,$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2},\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHCH}_{2} \ldots \ldots . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 73 ~$
Scheme 49. Improved synthesis of aryl trichlorocarbinols. $\mathrm{R}=o-\mathrm{CH}_{3}, m-\mathrm{CH}_{3}, p-\mathrm{CH}_{3}$,$o-\mathrm{OCH}_{3}, m-\mathrm{OCH}_{3}, p-\mathrm{OCH}_{3}, o-\mathrm{Cl}, m-\mathrm{Cl}, p-\mathrm{Cl} . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 74 ~$Scheme 50. Wyvratt synthesis of 2,2,2-trichloro-1-(3-nitrophenyl)ethan-1-ol 197.. 76
Scheme 51. 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU)-promoted addition of
chloroform to benzaldehyde. ..... 76
Scheme 52. Explanation for the observed selectivity using a Felkin-Anh model. ..... 80
Scheme 53. Addition of trichloromethyl anion to acetone via decarboxylation of
$\qquad$trichloroacetate salts.82
Scheme 54. Synthesis of trichloromethylhydroxy lactone 210. ..... 82
Scheme 55. Reaction of chloral with diethyl zinc. ..... 83
Scheme 56. Grignard reagent addition to chloral. $\mathrm{R}=\mathrm{Ph}, \mathrm{Me}$ ..... 84
Scheme 57. Aldol condensation of acetone and acetophenone with chloral. ..... 86
Scheme 58. Crossed-aldol reaction using a silyl enol ether ..... 87
Scheme 59. Reagents and conditions: alkyne 225 (1.1 equiv.), $\mathrm{Cl}_{3} \mathrm{CCHO}$ (1.0 equiv.), $\mathrm{ZnCl}_{2}$ (1.5 equiv.), $\mathrm{NEt}_{3}$ ( 1.5 equiv.). ..... 87
Scheme 60. Yields and enantiomeric excesses of trichloroketone reductions. Typicalconditions: ketone ( 1.0 mmol ), $\mathrm{HCO}_{2} \mathrm{H} / \mathrm{NEt}_{3}(5: 2,0.5 \mathrm{~mL})$, under $\mathrm{N}_{2}, 28^{\circ} \mathrm{C}, 5-17 \mathrm{~h}$.All results shown were obtained using catalyst $(R, R)$-241. ...................................... 92
Scheme 61. Catalytic cycle for the tertiary amine-catalysed aldol lactonisation of
ketene $\mathbf{2 5 2}$ with chloral. ..... 97
Scheme 62. The absolute configuration of $\mathbf{2 5 9 b}$ and 171 were confirmed as $(R)$ bycomparison of optical rotations to literature data. ${ }^{319,320}$ The remaining lactones wereassumed to be of the same configuration.97
Scheme 63. General Jocic reaction mechanism, depicted with an alkoxide nucleophile.

$\qquad$ ..... 98
Scheme 64. Synthesis of $\alpha$-methoxyaryl acetic acids. ..... 99
Scheme 65. Synthesis of $\alpha$-methoxyaliphatic acetic acids. $\mathrm{R}=$ alkyl. ..... 99
Scheme 66. $\mathrm{R}^{1}=\mathrm{CH}_{3}, \mathrm{C}_{2} \mathrm{H}_{5} ; \mathrm{R}^{2}=\mathrm{H}, \mathrm{OBn} ; \mathrm{X}=\mathrm{H}, \mathrm{Cl}, \mathrm{Br}$. ..... 100
Scheme 67. Reagents and conditions: phenol (2.0 equiv.), NaOH (8.0 equiv.), acetone,
rt, 16 h. ..... 100
Scheme 68. Reaction of alkenyl trichlorocarbinols with various nucleophiles. ..... 102
Scheme 69. Reagents and conditions: $\mathrm{KNH}_{2}$ (4.6 equiv.), $\mathrm{NH}_{3}(1),-33{ }^{\circ} \mathrm{C}, 12 \mathrm{~h} . \mathrm{R}=$
$\qquad$$\mathrm{Et}, i-\mathrm{Pr}, \mathrm{Ph}$.103
Scheme 70. Reagents and conditions: $\mathrm{NCNH}_{2}$ ( 2.4 equiv.), KOH (5.9 equiv.), ROH ,rt, overnight. $\mathrm{R}=\mathrm{CH}_{3}, \mathrm{C}_{2} \mathrm{H}_{5}, n-\mathrm{Pr}, n-\mathrm{Bu} ; \mathrm{X}=\mathrm{H}, p-\mathrm{Cl}, p-\mathrm{OMe} . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 103 ~$Scheme 71. Jocic reaction of thiourea with aryltrichlorocarbinols. $\mathrm{R}=\mathrm{H}, 3,4$-dichloro,
$\qquad$p-OMe.104
Scheme 72. Additional reactions with sulfur nucleophiles. ..... 104
Scheme 73. The original Jocic reaction. ..... 105
Scheme 74. Various homologation procedures developed by Snowden et al. $\mathrm{R}^{1}=$alkyl, alkenyl, aryl; $\mathrm{NH}\left(\mathrm{R}^{2}\right)_{2}=\mathrm{NH}_{2}$, benzylamine, morpholine.106
Scheme 75. Proposed conversion of dichloroepoxide $\mathbf{3 0 9}$ to carboxylate $\mathbf{3 0 7}$ usingsodium phenylseleno(triethyl)borate complex.107
Scheme 76. Stereospecific synthesis of ( $S$ )-citramalic acid. ..... 108
Scheme 77. Stereoselective synthesis of $\alpha$-hydroxy esters. $\mathrm{R}=n$-pentyl, $\mathrm{C}_{6} \mathrm{H}_{5}\left(\mathrm{CH}_{2}\right)_{2}$,cyclohexyl, $t$-butyl.108
Scheme 78. Synthesis of an epoxycarboxylic acid via an intramolecular Jocic reaction.
TBAOH $=$ tetrabutylammonium hydroxide. ..... 109
Scheme 79. Stereospecific synthesis of an $\alpha$-azido $\gamma$-lactone. Reagents and conditions:
DIBAL (1.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 10 \mathrm{~h} ; \mathrm{NaOH}$ ( 4.0 equiv.), $\mathrm{NaN}_{3}$ ( 2.0 equiv.),
DME/ $\mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 12 \mathrm{~h}$. ..... 110
Scheme 80. Attempted synthesis of $\delta$-lactam 327. ..... 111
Scheme 81. Synthesis of a 3,4-syn-disubstituted azetidine-2-carboxylic acid. ..... 111
Scheme 82. Synthesis of piperazin-2-ones. $\mathrm{R}^{1}=\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Ph}, \mathrm{R}^{2}=$ alkyl, aryl. ..... 112
Scheme 83. Synthesis of (+)-LY354740. ..... 113
Scheme 84. Reagents and conditions: DBU (1.0 equiv.), $\mathrm{NaN}_{3}$ (2.0 equiv.), DME/ $\mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 24 \mathrm{~h}$. ..... 113
Scheme 85. Synthesis of two bis-amino acid monomer precursors. ..... 114
Scheme 86. Discovery synthesis of lead compound 348 ..... 114
Scheme 87. Optimised synthesis for large-scale production. ..... 115
Scheme 88. Conditions: a) DBU, $\mathrm{MeOH}, 83 \%$; b) $\mathrm{CsF}, \mathrm{DBU}, \mathrm{MeOH}, 85 \%$; ..... c)
$\mathrm{NaOMe}, \mathrm{MeOH}, 54 \%$; d) NaCN, DBU, $\mathrm{MeOH}, 80 \%$; e) KOCN, DBU, MeOH, $50 \%$115
Scheme 89. Reagents and conditions: ketone (8.0 equiv.), $\mathrm{CHCl}_{3}$ (1.3 equiv.), NaOH
(4.5 equiv.), $\quad 10^{\circ} \mathrm{C}, 20 \mathrm{~h} . \mathrm{R}^{1} / \mathrm{R}^{2}=$ alkyl, cycloalkyl; $\mathrm{R}^{3}=$ alkyl. ..... 116
Scheme 90. Disconnections for the synthesis of vitamin E. $\mathrm{R}^{1}, \mathrm{R}^{2}, \mathrm{R}^{3}=\mathrm{CH}_{3}$ or H .118
Scheme 91. Friedel-Crafts acylation of anisole with trichlorolactone ( $R$ )-254a. ..... 119
Scheme 92. Synthesis of (S)-citramalic acid by Wynberg and Staring. ..... 119
Scheme 93. Synthesis of ( $1 S, 3 S$ )-austrocortilutein. ..... 120
Scheme 94. Proposed Friedel-Crafts acylation of protected hydroquinones. ..... 120
Scheme 95. Methylation of hydroquinones ..... 121
Scheme 96. Attempted ring opening of lactone 171 under Friedel-Crafts conditions.
$\qquad$121
Scheme 97. Attempted ring opening of lactone $\mathbf{1 7 1}$ by lithiation of arenes $\mathbf{3 6 4}$ and
365. TMEDA = tetramethyl ethylenediamine ..... 121
Scheme 98. Attempted ring opening of lactone 171 by the lithium exchange of bromobenzenes. NBS $=\mathrm{N}$-bromosuccinimide ..... 122
Scheme 99. Successful ring opening of lactone 171 ..... 122
Scheme 100. Failed ortho-selective demethylation reaction. ..... 123
Scheme 101. Unsuccessful demethylation using NaI or LiI. ..... 123
Scheme 102. Demethylation of methyl ether 373. ..... 124
Scheme 103. Optimised demethylation protocol. ..... 124
Scheme 104. Intramolecular Jocic reaction mechanism. ..... 125
Scheme 105. Synthesis of diastereomeric amides $\mathbf{3 8 0}$. ..... 126
Scheme 106. Synthesis of 4-oxo-chromane ( $\pm$ )-382 ..... 126
Scheme 107. Failed acid-catalysed aldol condensation ..... 127
Scheme 108. Attempted synthesis of monoprotected phenol 386. ..... 129
Scheme 109. Successful ring opening reaction of lactone 171. ..... 129
Scheme 110. Synthesis of ester 387 ..... 131
Scheme 111. Synthesis of racemate ( $\pm$ )-387. ..... 131
Scheme 112. Planned synthesis of aldehyde 35. ..... 133

## Adnowledgements

The University of Warwick are gratefully acknowledged for funding this project.

First and foremost though, many thanks must go to Fox for his assistance and supervision throughout my research. His enthusiasm as both an academic and a teacher are infectious and helped me to stay motivated and happy for the last three and a half years.

Thanks should also go to members of the Fox group, past and present, for helpful discussions. Particular thanks go to the mass spectrometry facility staff, Dr Lijiang Song and Mr Phillip Aston, as well as Dr Ivan Prokes and Mr Robert Perry for running the NMR facilities.

Finally, thanks must go to family and friends for invaluable support. In particular Ellie Harlow, who was always there for me when needed.

## Dedaration

All of the work described in this thesis is original research carried out at the University of Warwick between October 2014 and April 2018. I declare that any material described which is not original has been identified and properly referenced. I certify that the material within this thesis has not been submitted for a degree at any other university.

#### Abstract

This thesis begins with an introduction to Vitamin E and the Jocic reaction. Chapter 1 provides a review of the biological activity of vitamin E and related compounds and the synthesis, both racemic and asymmetric, of vitamin E compounds. Also discussed in this chapter is the Jocic reaction and the synthesis of trichloromethyl alcohol compounds.

Chapter 2 describes the asymmetric total syntheses of both $\alpha$ - and $\beta$-tocopherol, where an intramolecular Jocic reaction was used to provide a high enantiomeric excess. Difficulties encountered during the synthesis, and how these were overcome, are detailed.

Chapter 3 describes the novel use of hydride as a nucleophile in the Jocic reaction with tertiary polychloromethyl alcohols. This one-carbon homologation procedure was improved by the use of dichloro- rather than trichloromethyl alcohols. The scope of the reaction, mechanisms and stereochemical implications are discussed.

## Chapter 1: Introduction to Vitamin E and the Jodic

## Reaction

### 1.1 Discovery of Vitamin E

Vitamin E is the name given to a class of naturally occurring antioxidants consisting of eight different compounds. These eight compounds are divided into the tocopherols and the tocotrienols (Figure 1), which differ only in unsaturation of the phytyl side
chain. Depending on the extent and position of methylation around the aromatic ring these compounds are further designated $\alpha, \beta, \gamma$ or $\delta$.

$\alpha$-Tocopherol: $\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{Me} \quad 1$ $\beta$-Tocopherol: $\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{H} \quad 2$ $\gamma$-Tocopherol: $\mathrm{R}^{1}=\mathrm{H}, \mathrm{R}^{2}=\mathrm{Me} \quad 3$ $\delta$-Tocopherol: $\mathrm{R}^{1}=\mathrm{H}, \mathrm{R}^{2}=\mathrm{H} \quad 4$
$\alpha$-Tocotrienol: $\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{Me} \quad 5$ $\beta$-Tocotrienol: $\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{H} \quad 6$ $\gamma$-Tocotrienol: $\mathrm{R}^{1}=\mathrm{H}, \mathrm{R}^{2}=\mathrm{Me} \quad 7$ $\delta$-Tocotrienol: $\mathrm{R}^{1}=\mathrm{H}, \mathrm{R}^{2}=\mathrm{H} \quad 8$

Figure 1. Naturally occurring vitamin E compounds.

In 1922, Evans and Bishop reported that rats which were fed an unnatural diet consisting mainly of milk, cornstarch and adequate vitamin A, B and C were infertile, and that fertility was restored by the feeding of lettuce leaves. ${ }^{1}$ They had demonstrated that natural foods contained a substance essential for reproduction. Other groups reported the same results from similar experiments and the substance was first termed "Vitamin E" since vitamins A, B, C and D were already known. ${ }^{2-4}$ Much of the early studies on the antioxidant activity of vitamin E were carried out by Mattill ${ }^{5-10}$ and Evans. ${ }^{11}$ Mattill and co-workers were one of the first groups to suggest that vitamin E acted as an antioxidant; they did this by measuring the uptake of oxygen from a variety of vegetable and animal fats and noted that uptake of oxygen was considerably slower in the presence of wheat germ oil (the best source of vitamin E at the time). ${ }^{12,13}$ Evans et al. isolated $\alpha$-tocopherol in pure form from wheat germ oil in $1936^{14}$ and shortly after its chemical structure was fully elucidated. ${ }^{15}$ Olcott and Emerson then demonstrated the antioxidant activity of $\alpha, \beta$ and $\gamma$-tocopherols towards unsaturated fats definitively for the first time. ${ }^{16}$

### 1.2 Mechanismof Adtion

Lipid autoxidation (Scheme 1) is the process by which long chain fatty acids undergo oxidation under mild conditions, leading to rancidity. ${ }^{17-19}$ In biological systems, the process is referred to as peroxidation and can result in the modification of low density lipoprotein (LDL) $)^{20}$ and tissue damage. ${ }^{21-23}$

Scheme 1. Lipid autoxidation free radical chain reaction.

In order to measure the kinetics of lipid autoxidation using equations 1-4 (Scheme 1), the rate of initiation needs to be controlled and this is most commonly achieved using thermally-labile azo compounds as initiators. ${ }^{24-26}$ Within biological systems initiators such as $\mathrm{Fe}^{+}$ions, ${ }^{27-30}$ organic hydroperoxides, ${ }^{31-33} \mathrm{CCl}_{4}{ }^{34,35}$ and ethanol ${ }^{36,37}$ have all been described. The alkyl radicals $(\mathrm{L} \bullet)$ generated are highly reactive and will react quickly with oxygen to form lipid peroxy radicals (LOO•), which react with further lipids to form lipid hydroperoxides ( LOOH ) and $\mathrm{L} \cdot$ radicals which propagate the chain. Termination via dimerisation takes place when almost all of the lipids LH have been consumed.

Phenols are well known to act as inhibitors in radical chain reactions. ${ }^{38-41}$ This is primarily due to their ability to donate a hydrogen atom to a propagating radical, thus terminating the chain. Therefore the antioxidant activity of vitamin E can be described by equations 5 and 6 (Scheme 2), where the phenol hydrogen atom (TOH) is donated to a lipid peroxy radical, forming a chromanoxyl radical (TO•).

$$
\begin{align*}
& \mathrm{LOO}+\mathrm{TOH} \xrightarrow{k_{5}} \mathrm{LOOH}+\mathrm{TO}  \tag{5}\\
& \mathrm{LOO}^{\circ}+\mathrm{TO}^{\cdot} \xrightarrow{k_{6}} \text { nonradical adducts } \tag{6}
\end{align*}
$$

Scheme 2. Inhibition of free radical propagation by tocopherols.

The chromanoxyl radical (TO•) will undergo radical-radical coupling to form adducts. Depending on whether the other radical is carbon-based or oxygen-based, the adduct will tend to be formed at the chromanoxyl oxygen ${ }^{42}$ or at the $8 a^{43,44}$ position respectively (Scheme 3).

Scheme 3. Reactions of $\alpha$-tocopherol with peroxyl radicals.

The tocopherones $\mathbf{1 0 - 1 3}$ are then hydrolysed to the corresponding quinones by opening of the chromane ring. According to equations (5) and (6), one tocopherol molecule is therefore theoretically able to neutralise two lipid peroxy radicals.

### 1.3 Influence of Substituents on Adivity

Vitamin E components have been the topic of a number of studies into antioxidant activity. ${ }^{45-56}$ This antioxidant activity is primarily due to the ability of the tocopherols to terminate free radical chain reactions as discussed previously (Schemes 1 and 2). Therefore, in order to be an effective chain-breaking antioxidant the rate constant for
reaction (5) must be much greater than that for (3), $k_{5} \gg k_{3}$ (Schemes 1 and 2), which implies a high reactivity towards peroxy radicals. Howard and Ingold measured $k_{5}$ for a range of phenolic antioxidants with various substitution patterns, a selection of which are shown in Table 1. ${ }^{41,57}$

|  | $\mathbf{R}^{1}$ | $\mathbf{R}^{2}$ | $\mathbf{R}^{3}$ | $10^{-5} k_{5}\left(M^{-1} \mathrm{~s}^{-1}\right)$ |

| $\beta$-tocopherol | 130 | $\delta$-tocopherol | 44 |

Table 2. $\mathrm{k}_{5}$ values for the natural tocopherols at $30^{\circ} \mathrm{C}$.

They found that the greatest $k_{5}$ values were obtained with a $p$-methoxy substituent, and with three methyl groups in the other positions. From the data it was concluded that for simple phenols, $k_{5}$ is dependent both on the radical stabilising effect of groups in the ortho and para positions and on steric hindrance preventing the approach of the peroxy radical. For example, in the same study they found that 2,6 -di-tert-butyl phenols were less reactive than the corresponding 2,6-dimethyl phenols due to the increased steric bulk of the tert-butyl group.

The $k_{5}$ values for the natural tocopherols were also measured under the same conditions and found to be in the order $\alpha>\beta \approx \gamma>\delta$ (Table 2), which has also been reported by others in vitro. ${ }^{58}$ Due to their structural similarities it might be expected that $p$-methoxy-2,3,5,6-tetramethyl phenol should have a comparable antioxidant activity to $\alpha$-tocopherol, but instead it was found that $\alpha$-tocopherol was much more active. Given that there is no difference in steric hindrance in the positions ortho to the phenol group, the authors concluded that there must be a difference in the stability of the radicals formed.

If the group in the para position has lone pairs available these can overlap with the $\pi$ system of the aromatic ring, which stabilises the phenoxyl radical by delocalisation (Scheme 4).

Scheme 4. Stabilisation of phenoxyl radicals by delocalisation.

In order for the lone pair electrons to overlap effectively they need to be perpendicular to the aromatic plane, and the extent of overlap will depend on the dihedral angle ( $\theta$ ) between the lone pair orbital on oxygen 1 and the $p$ orbitals in the aromatic ring. Therefore a dihedral angle closer to $0^{\circ}$ maximises the orbital overlap while an angle closer to $90^{\circ}$ represents a minimum overlap. In $p$-methoxy-2,3,5,6-tetramethyl phenol the methoxy group can twist out of the plane in order to reduce steric clashing, resulting in a dihedral angle of $89^{\circ}$ (Figure 2). ${ }^{57,59,60}$ Orbital overlap is at a minimum and the oxygen lone pair is not able to stabilise the radical.

Figure 2. Newman projection of 4-methoxy-2,3,5,6-tetramethyl phenoxyl radical.

On the other hand, pentamethyl-6-hydroxy chromane is not able to twist out of the plane to the same extent due to its bicyclic nature, resulting in a dihedral angle of $17^{\circ}$ and better orbital overlap (Figure 3). ${ }^{57,59,60}$ Consequently, the chromane compound is able to stabilise the radical to a greater extent resulting in a larger $k_{5}$ value. This appears to be the fundamental reason for high vitamin E antioxidant activity compared to phenols which lack the fused ring system.

Figure 3. Newman projection of pentamethyl-6-hydroxy chromanoxyl radical.

Burton et al. investigated the effect of substitution on the chromane ring in an attempt to find a compound with greater antioxidant activity than $\alpha$-tocopherol (Table 3). ${ }^{61} \mathrm{An}$ increase in $k_{5}$ was seen when the phytyl side chain was substituted for a $\mathrm{CH}_{3}$ group, due to a decrease in puckering of the chromane ring resulting in a dihedral angle closer to $0^{\circ}$ than in $\alpha$-tocopherol. When $\mathrm{R}^{2}=\mathrm{CO}_{2} \mathrm{H}$ or $\mathrm{CO}_{2} \mathrm{CH}_{3}$ (compounds $\mathbf{1 5 d}$ and 15e) a decrease in activity is seen. The authors attribute this to an electron-withdrawing effect which reduces the ability of oxygen $(\mathrm{X}=\mathrm{O}$, Table 3 ) to donate its lone pair, consequently lowering the stability of the radical. Compound 15d had previously been shown to be a more potent antioxidant than $\alpha$-tocopherol in fats. ${ }^{62,63}$

Table 3. The effect on $k_{5}$ of substitution around the chromane ring.

It might be expected that the compound with $\mathrm{X}=\mathrm{NCH}_{2} \mathrm{CH}_{3}$ (tetrahydroquinoline, $\mathbf{1 5 h}$ ) should have higher activity than compounds with $X=O$ due to the greater ability of nitrogen to stabilise neighbouring radical centres. ${ }^{64,}{ }^{65}$ However, a decrease in activity relative to $\alpha$-tocopherol was measured. The reason for this is suggested to be that the $N$-ethyl group occupies the axial position in order to reduce steric clashing with the C-8 methyl group, preventing the nitrogen lone pair from overlapping with the $\pi$ system (Figure 4).

Figure 4. Presumed conformation of compound $\mathbf{1 5 h}$, with the nitrogen lone pair perpendicular to the $\pi$ system.

However, this conclusion was drawn from space-filling models as the authors were unable to grow crystals for X-ray crystallography. Compound $\mathbf{1 5 i}$ with $\mathrm{n}=1(2,3-$ dihydrobenzofuran) showed the greatest $k_{5}$ value in the study, and this has been shown to be due to the small dihedral angle of $6^{\circ}$ which increases radical stability as discussed previously. ${ }^{57,}{ }^{60}$ Other groups have carried out similar structure activity relationship (SAR) studies of this type. ${ }^{66,67}$

Studies of the type by Burton et al. above are typically carried out by measuring the inhibited autoxidation of styrene in non-polar, organic solvent. Mukai et al. investigated the reaction of an ArO• radical with $\alpha$-, $\beta$-, $\gamma$-, and $\delta$-tocopherols, together with a selection of structurally related phenols, in a micellar solution designed to mimic cell membranes (Table 4). ${ }^{58}$

The data they obtained showed that the activity of the tocopherols is in the order $\alpha>$ $\beta \approx \gamma>\delta$ in both micellar and ethanol solutions. The increase in rate constant seen in micellar solution is due to the lipophilicity of the compounds. They will be localised within the micelles and since the ArO• radicals are also lipid soluble, the reaction will take place inside the micelle. This close association is responsible for the large increase in rate. Tocol was shown to be around $90 \%$ less reactive towards radicals and this is due to a lack of electron donating groups ortho to the phenol.

Ubiquinol-0 and ubiquinol-10 are known to act as lipid antioxidants in cell membranes. ${ }^{68-70}$ The rate constant $k_{5}$ in micelles measured in this study was found to be comparable to vitamin E and a "regenerative" mechansim has been observed in vitro, whereby ubiquinol-10 donates an H atom to the Toc• radical (Scheme 5). ${ }^{58,71,72}$ This type of synergistic relationship has been directly observed with ascorbic acid (vitamin C). ${ }^{73-76}$

### 1.4 Comparison Between $\alpha$-, $\beta$-, $\gamma$ - and $\delta$-forms

### 1.4.1 In Vitro

In vitro studies have shown $\alpha$-tocopherol to be the most active form of vitamin E and $\delta$-tocopherol to be the least active, with the $\beta$ - and $\gamma$-forms in between. ${ }^{50,52,57-59,77}$ This must be primarily due to the greater extent of methylation of $\alpha$-tocopherol around the aromatic ring, as discussed previously, since the dihedral angles imply a greater orbital overlap between the ring oxygen and the arene $\pi$ system in $\gamma$ - and $\delta$ tocopherol. ${ }^{78-80}$ In addition, a greater number of electron donating groups would be expected to stabilise a radical to a greater extent. However, studies of this type appear to be highly dependent on a number of experimental factors. For example, Cillard et al. studied the autoxidation of linoleic acid with and without tocopherols. They found that the antioxidant activities were in the reversed order, with $\delta$-tocopherol most potent. ${ }^{81}$ This has also been reported by other authors when measuring the relative antioxidant activities in fats. ${ }^{82-84}$ Due to the reactive nature of radicals a number of side reactions can take place which may be dependent on the substrate being studied, ${ }^{85}$, ${ }^{86}$ temperature, ${ }^{86}$ light, ${ }^{86}$ concentration ${ }^{87-89}$ or solvent. ${ }^{90,91}$ This wide range of variables may explain the contradictory nature of the reports in the literature and makes it difficult to compare results from different authors.

### 1.4.2 In Vivo

Whilst the relative antioxidant activities of the four tocopherols are all within an order of magnitude in vitro, in biological systems $\alpha$-tocopherol is by far the most important antioxidant. Leth and Sondergaard used a rat resorption-gestation assay to determine the relative biological activities of the tocopherols (Table 5). ${ }^{92}$ They found that $\delta$ tocopherol had $<0.4 \%$ activity relative to so-called (all-rac)- $\alpha$-tocopheryl acetate and similar results have been reported elsewhere in the literature. ${ }^{93-97}$

| substrate | biological activity (\%) | $\boldsymbol{\alpha}$-TTP binding affinity (\%) |
| :--- | :---: | :---: |
| $(R, R, R)$ - $\alpha$-tocopherol | 80 | 100 |
| $(R, R, R)$ - $\beta$-tocopherol | 45 | $38.1 \pm 9.3$ |
| $(R, R, R)$ - $\gamma$-tocopherol | 13 | $8.9 \pm 0.6$ |
| $(R, R, R)-\delta$-tocopherol | $<0.4$ | $1.6 \pm 0.3$ |
| $(R, R, R)$ - $\alpha$-tocopheryl acetate | - | $1.7 \pm 0.1$ |
| $(S, R, R)$ - $\alpha$-tocopherol | - | $10.5 \pm 0.4$ |

Table 5. Comparison of natural tocopherols. ${ }^{\text {a }}$ Relative to $\left(2 R S, 4^{\prime} R S, 8^{\prime} R S\right)$ - $\alpha$-tocopheryl acetate (=100\%). ${ }^{\mathrm{b}}$ Measured by calculating the relative $\mathrm{IC}_{50}$ values.

Given that this difference cannot be explained by the relative chemical reactivity of the tocopherols alone, other factors relating to their distribution, transport or bioavailability in cell tissues must be governing the measured relative activity. The most important factor appears to be recognition by the $\alpha$-tocopherol transfer protein ( $\alpha$-TTP), which is the protein responsible for maintaining plasma $\alpha$-tocopherol concentrations. ${ }^{98-100}$

Hosomi et al. measured the relative binding affinities for tocopherols and tocopherol analogues to $\alpha$-TTP (Table 5). ${ }^{101}$ They found that $(R, R, R)-\alpha$-tocopherol displayed the highest binding affinity and $\delta$-tocopherol displayed the lowest, which correlates well with the relative biological activities in vivo. In addition, they also studied the effect of stereochemistry on the binding affinity. From their results it can be seen that $\alpha$ tocopherol with the $(2 R)$-configuration has an almost 10 -fold higher binding affinity to $\alpha$-TTP than $\alpha$-tocopherol with the ( $2 S$ ) configuration. Both of these results and similar studies by other groups ${ }^{102-105}$ suggest that $(R, R, R)$ - $\alpha$-tocopherol is the optimal substrate for $\alpha$-TTP and therefore it will be preferentially transported into cell membranes.

The metabolism of vitamin E provides an additional explanation for the differences in observed potency. It has been shown that the non- $\alpha$-tocopherols are preferentially metabolised to the 2'-carboxyethyl-6-hydroxychromane (CEHC) forms by cytochrome P450s (Scheme 6). ${ }^{106,107}$

Scheme 6. Pathway of metabolism of $\gamma$-tocopherol to its $\gamma$-CEHC form.

The fate of non- $\alpha$-tocopherols is of importance given that the North American intake of $\gamma$-tocopherol exceeds that of $\alpha$-tocopherol by a factor of 2-4. ${ }^{108,109}$ Soybean oil is thought to be the primary source of ingestion of vitamin E in the US diet, and this oil has been shown to contain 3-4 fold higher quantity of $\gamma$-tocopherol compared to $\alpha$ tocopherol. ${ }^{110} \gamma$-Tocopherol may also have different reactivity due to the potentially nucleophilic C-5 site which is blocked in $\alpha$-tocopherol. Cooney et al. showed that the
reaction of $\gamma$-tocopherol with low levels of $\mathrm{NO}_{2}$ yielded $2,7,8$ trimethyl-2-( $4^{\prime}, 8^{\prime}, 12^{\prime}-$ trimethyldecyl)-5-nitro 6-chromanol 16 and 2,7,8-trimethyl-2-(4', $8^{\prime}, 12^{\prime}$ -trimethyltridecyl)-5,6-chromaquinone 19 (Scheme 7). ${ }^{111,112}$ Other groups have demonstrated the ability of $\gamma$-tocopherol to trap mutagenic electrophiles. ${ }^{110,113}$ It has also been suggested that $\gamma$-tocopherol may play a specific role in the prevention of heart disease and cancer. ${ }^{114}$

Scheme 7. Proposed mechanism for the trapping of $\mathrm{NO}_{2}$ radicals by $\gamma$-tocopherol.

### 1.5 Vitamin E Deficiency in Humans

Patients with symptoms caused by vitamin E deficiency were first reported in the 1960s. ${ }^{15,}{ }^{116}$ This has been shown to be not due to lack of vitamin $E$ in the diet, but due to either a defect in the gene for $\alpha$-TTP, ${ }^{117-120}$ or malabsorption of fatty acids, ${ }^{121}$ resulting in a lack of $\alpha$-tocopherol at cell membranes and therefore increased lipid peroxidation. An increased oxidative stress on tissue cells can result in neurodegenerative disease, ${ }^{122}$ cardiovascular disease, ${ }^{123}$ myopathy, ${ }^{124,125}$ or peripheral neuropathy. ${ }^{126}$ The reason for this is attributed to a dying back of sensory nerves. ${ }^{127}$

### 1.6 Potential Non-antioxidant Applications

A number of roles not associated with antioxidant activity have been proposed for the tocopherols, including regulation of protein kinase $\mathrm{C}^{128-130}$ and inhibition of cell proliferation. ${ }^{131,132}$ This conclusion was based largely on the fact that $\alpha$-tocopherol had an effect on the signalling pathways whilst non- $\alpha$ forms did not. However, it has been suggested that these signalling pathways may in fact be dependent on the oxidative stress of the cell or tissue in question rather than being directly controlled by $\alpha$-tocopherol. ${ }^{133}$ Therefore, the apparent regulation of signalling pathways and other roles suggested for vitamin E may come back to its primary antioxidant function.

Vitamin E and analogues such as $\alpha$-tocopheryl succinate ( $\alpha$-TOS) and $\alpha$-tocopherol ether-linked acetic acid ( $\alpha$-TEA) have been shown to have potent anticancer properties in some cell types. ${ }^{134-139}$ Chen et al. synthesised a number of related vitamin E analogues for anticancer functions (Table 6). ${ }^{140}$ The data in table 6 shows that the highest anticancer activity was obtained with ether-linked analogues 21 and 22. Chen et al. speculated that this may be due to the ether increasing the hydrophilicity of the compound and increasing uptake in the cells, but the mechanism is unknown.

Pharmaceutical compounds incorporate fluorine in order to increase bioavailability, lipophilicity or binding with a target protein. ${ }^{141}$ It has also been shown that fewer methyl groups on the chromane head group may increase anticancer activity. ${ }^{136}$ Therefore, the authors synthesised $\mathbf{2 0}$ and $\mathbf{2 3}$, which are fluorinated at the $\mathrm{C}-7$ position and unsubstituted at C-5 and C-8. These compounds were found to exhibit similar anticancer activity to $\alpha$-TEA. However, given the considerable difference observed between the in vitro and in vivo antioxidant activity of the tocopherols due to their differing bioavailability, similar effects may be observed with anticancer activity. Therefore in vivo studies are potentially more useful.

Table 6. $\mathrm{EC}_{50}$ values ( $\mu \mathrm{M}$ ) for vitamin E analogues.

### 1.7 Tocotrienols

In comparison to the tocopherols, much less work has been done on the tocotrienols, which only differ in the phytyl side chain unsaturation (Figure 1). In vivo studies showed that $\alpha$-tocotrienol has $30 \%$ of the biological activity of $\alpha$-tocopherol and $\beta$ tocotrienol has only $5 \%$ of the activity of $\beta$-tocopherol, as determined by the rat resorption-gestation assay. ${ }^{142}$ This can be attributed to discrimination by the $\alpha$-TTP which specifically recognises a saturated phytyl chain. ${ }^{143,144}$ Consequently, the tocotrienol forms of vitamin E are not retained in tissues and membranes to the same extent as the tocopherols, resulting in lower biological activity.

Studies suggest that $\alpha$-tocotrienol has a higher antioxidant activity than $\alpha$-tocopherol in vitro. ${ }^{145,146}$ Suzuki et al. found $\alpha$-tocotrienol to have greater reactivity towards peroxy radicals in membrane systems, whilst both tocopherol and tocotrienol forms
were identical in hexane solution. ${ }^{147}$ Since the only structural difference between the two is in the side chain, this suggests that differing arrangements in the membrane could be affecting the reactivity. From their results Suzuki et al. suggested that $\alpha$ tocotrienol is located closer to the membrane surface than $\alpha$-tocopherol, allowing for greater interaction with peroxy radicals. However, work by Yoshida et al. yielded contrary results to those above, where they found very little difference in antioxidant activity between $\alpha$-tocopherol and $\alpha$-tocotrienol in membrane systems. ${ }^{148}$

### 1.8 Vitamin E Synthesis in Industry

( $R, R, R$ )- $\alpha$-Tocopherol is the most biologically relevant form of vitamin E due to its higher activity. However a mixture of all eight stereoisomers, so-called (all-rac)- $\alpha$ tocopherol 26, is the most important compound commercially. The first synthesis of $\alpha$-tocopherol was reported by Karrer et al. in 1938, by the acid-catalysed condensation of trimethylhydroquinone $\mathbf{2 4}$ with phytyl bromide $\mathbf{2 5}$ (Scheme 8). ${ }^{149,150}$

24 $\mathrm{ZnCl}_{2}$
Petroleum ether, reflux 6 h $\downarrow$

Scheme 8. First reported synthesis of $\alpha$-tocopherol.

Note that phytyl bromide $\mathbf{2 5}$ was derived from natural (enantiomerically enriched) phytol, since this was the only available source of the compound at the time.

The current industrial-scale synthesis of (all-rac)- $\alpha$-tocopherol and (all-rac)- $\alpha$ tocopheryl acetate consists of the acid-catalysed condensation of
trimethylhydroquinone and (all-rac)-isophytol 27 (Scheme 9). Considerable effort has gone into the development of alternative catalysts to replace the conventional Lewis acids $\left(\mathrm{ZnCl}_{2}, \mathrm{AlCl}_{3}, \mathrm{BF}_{3}\right.$ among others), in order to increase selectivity and yield with a lower catalyst loading. ${ }^{151-153}$ Trimethylhydroquinone is accessible on an industrial scale from mesitol, isophorones or diethyl ketone. ${ }^{152,154}$ (All-rac)-isophytol 27 is accessible using isoprenoid chemistry, in particular the acid-catalysed Carroll ${ }^{155}$ and Saucy/Marbet ${ }^{156}$ reactions for $\mathrm{C}_{3}$ elongations. The starting materials are acetone, ethyne and hydrogen (Scheme 10).

Scheme 9. Industrial synthesis of (all-rac)- $\alpha$-tocopherol 28 and its acetate 29.

Scheme 10. Industrial synthesis of (all-rac)-isophytol 27.

Given the increased biological activity of specifically $(R, R, R)$ - $\alpha$-tocopherol compared to the lower homologues and other stereoisomers, access to this compound on an industrial scale is important for pharmaceutical applications. Currently this is achieved by the processing of natural materials, such as soya beans and vegetable oil, which are rich in $(R, R, R)-\alpha$-tocopherol. However, these materials also contain the lower homologues and so a "semi-synthetic" approach is used. All the tocopherols are first isolated by extraction, and then upgraded to the $\alpha$-form using halo-, ${ }^{157}$ amino-, ${ }^{158}$ or hydroxy- ${ }^{159}$ alkylation-reduction sequences (Scheme 11).

Scheme 11. Representative procedure for the upgrading of $\gamma$-tocopherol to $\alpha$-tocopherol.

Netscher et al. have optimised procedures of this type using morpholine as the Mannich reagent in a variety of ratios with formaldehyde. ${ }^{160}$ By adjusting the stoichiometry to 1:1-1.2 [ $\delta$-tocopherol:morpholine] they were also able to monoalkylate $\delta$-tocopherol to the $\beta$ - form, due to the higher reactivity of the $\mathrm{C}-5$ position compared to the C-7 position. The reduction step is typically carried out using $\mathrm{H}_{2}$ and $\mathrm{Pd} / \mathrm{C}$ and the authors screened a considerable number of hydride reductants in an attempt to find alternative reagents. They found that $\mathrm{NaCNBH}_{3}$ or $\mathrm{NaBH}_{4} / \mathrm{NaOH}$ in $i$ - BuOH were effective in the reduction of 5-(aminomethylated)- $\gamma$-tocopherol, but less effective when bis(aminomethylated)- $\delta$-tocopherol was used as the substrate.

Relatively recent advances in catalytic asymmetric hydrogenation, based on the pioneering work of Noyori and co-workers, have allowed construction of the enantioand diastereomerically enriched side-chain component $\mathbf{3 2}$ on an industrial scale (Scheme 12).

Scheme 12. Asymmetric hydrogenation of olefins using Ru and Ir catalysts.

Conditions developed by Noyori et al. ${ }^{161,162}$ were used at Roche to convert 30 into ( $R, R$ )-hexahydrofarnesol 32, on a pilot scale with substrate:catalyst ratios of up to 150000:1. ${ }^{163}$ Pfaltz et al. developed an Ir catalyst capable of the asymmetric hydrogenation of unfunctionalised, trialkyl substituted olefins with > $90 \%$ d.e. and > $99 \%$ e.e. ${ }^{164,} 165$ In this way farnesol, 31, was converted directly into $(R, R)$ hexahydrofarnesol 32. One disadvantage of this route is that ligand $\mathbf{3 4}$ is not commercially available, unlike the BINAP derived ligands used for Noyori-type asymmetric hydrogenations.

## $1.9 \alpha$-Tocopherol Asymmetric Total Synthesis

The asymmetric total synthesis of $(R, R, R)$ - $\alpha$-tocopherol has been reported a number of times in the literature. Most of the syntheses to date can be categorised into: $l$ ) those which feature a $\mathrm{C}_{1}{ }^{\prime}-\mathrm{C}_{2}{ }^{\prime}$ coupling; 2) those which feature a stereospecific ring closing reaction; and 3) those which feature a stereoselective ring closing reaction. The syntheses in category 1 are the most abundant and generally consist of the asymmetric construction of a chromane aldehyde (for example 35 or 36), followed by a Wittig coupling with a side chain component (for example $\mathbf{3 7}$ or $\mathbf{3 8}$, Scheme 13).

Scheme 13. $\mathrm{C}_{1}{ }^{\prime}-\mathrm{C}_{2}{ }^{\prime}$ coupling route towards $\alpha$-tocopherol.

Given the importance of the chromane moiety in vitamin E chemistry, some asymmetric approaches to their syntheses are also discussed below.

### 1.9.1 G'- ${ }^{\prime}$ ' Coupling Approach

The first reported asymmetric total synthesis of $\alpha$-tocopherol 1 was reported by Mayer et al. in $1963 .{ }^{166}$ Their synthesis was the first example of the Wittig coupling method shown in Scheme 13. They used chiral resolution to obtain aldehyde 36 (Scheme 14).

Scheme 14. Chiral resolution of racemic aldehyde ( $\pm$ )-36.

The authors were unable to resolve aldehyde ( $\pm$ )- $\mathbf{3 6}$ directly so it was converted into the carboxylic acid 39, from which both enantiomers could be resolved using quinine. Conversion into the enantiomerically enriched aldehyde $\mathbf{3 6}$ from the desired enantiomer 40 was achieved over four steps; this compound was then subjected to a Wittig coupling with phosphonium bromide 37, followed by hydrogenation over palladium to yield ( $R, R, R$ )- $\alpha$-tocopherol.

Chiral resolutions of this type are common in the asymmetric syntheses of $(R, R, R)-\alpha-$ tocopherol. Scott et al. used chiral resolution to synthesise precursor aldehyde 46, from which the synthesis was completed using a Wittig coupling (Scheme 15). ${ }^{167}$ Construction of the chromane ring was achieved using a Wadsworth-Emmons reaction and hydrolysis of the resulting ester gave the acid ( $\pm$ )-44. Resolution with $(S)-\alpha-$ methylbenzylamine gave the enantiomerically enriched acid 45 in $34 \%$ yield. The side chain component was derived from natural phytol as the $(R, R)$-diastereoisomer.

Scheme 15. Synthesis of aldehyde 46 by chiral resolution.

Schmid et al. demonstrated a synthetic route to the phytyl side chain component and used this in the total synthesis of $\alpha$-tocopherol. ${ }^{168,169}$ This synthesis was based on the multiple Grignard coupling of chiral $\mathrm{C}_{5}$ components, derived from the enantiomerically enriched lactone 47 (Scheme 16). ${ }^{170}$

Scheme 16. Synthesis of ( $3 R, 7 R$ )-1-bromo-3,7,11-trimethyldodecane 56. Some steps have been omitted for clarity.

The bromide fragment 48 was obtained with an e.e. of $>97 \%$ based on ${ }^{1} \mathrm{H}$ NMR analysis with the chiral shift reagent $\mathrm{Eu}(\mathrm{hfc})_{3}$. $(3 R, 7 R)$-1-Bromo-3,7,11trimethyldodecane 56 was synthesised in 11 linear steps with an overall yield of $36 \%$, based on the lactone 47. Completion of the synthesis of $\alpha$-tocopherol was achieved using the method of Mayer et al.

A chiral $\gamma$-butyrolactone 57 was also used as a starting material in a synthesis by Cohen et al. (Scheme 17). ${ }^{171}$ In this work the lactone $\mathbf{5 7}$ was elaborated into diketone $\mathbf{5 8}$ over a number of steps, followed by annulation and oxidation to generate the $p$ benzoquinone 59. This compound was cyclised in aqueous HCl and methanol to yield the bridged ketal $\mathbf{6 0}$, which could be reduced with $\mathrm{H}_{2}$ and $\mathrm{Pd} / \mathrm{C}$ to give the $(S)$ -chroman-2-methanol 61. None of the alternative seven-membered ring product was detected in the final reduction step, and only one enantiomer was observed by chiral shift ${ }^{1} \mathrm{H}$ NMR spectroscopy. Completion of the synthesis was carried out using the method of Mayer et al. to yield $\alpha$-tocopherol in a total of 13 steps and with an overall yield of $6.5 \%$.

Scheme 17. Synthesis of (S)-chroman-2-methanol 61

An alternative approach was demonstrated by Chan et al. in which the side chain was built directly onto the chromane head group (Scheme 18). ${ }^{172,173}$ The key steps in this synthesis were a stereospecific Claisen rearrangement and a coupling with the enantiomerically enriched Grignard reagent 67.

Scheme 18. Synthesis of $\alpha$-tocopheryl acetate.

The chromane aldehyde 46 was prepared as described by Scott et al. ${ }^{167}$ (Scheme 15). The required diastereomerically pure acetylenic carbinol $\mathbf{6 2}$ could be separated as a mixture of 3,5-dinitrobenzoates, followed by hydrolysis. Johnson-Claisen rearrangements are known to be highly stereoselective. ${ }^{174}$ Treatment of allylic alcohol 63 with triethylorthoacetate and propionic acid at $140^{\circ} \mathrm{C}$ yielded the $\left(2 R, 4^{\prime} R\right)$-ester 64, with an e.e. of $99 \%$. Completion of the synthesis was achieved by the coupling of tosylate 66 with the enantiomerically enriched Grignard reagent 67, analogous to the route of Schmid et al. (Scheme 16), in a total of ten linear steps (from aldehyde 46) and an overall yield of $8.5 \%$.

### 1.9.2 Other Approaches to Enantiomerically Enriched Chromanes

As can be seen above, the synthesis of enantiomerically enriched chromane structures commonly involves an optical resolution of a related racemic acid, often using chiral nitrogen bases such as quinine or ( $S$ )- $\alpha$-methylbenzylamine. Enzymatic kinetic resolutions have also been shown to provide very high e.e. values. ${ }^{175,176}$ Asymmetric syntheses are less common. Solladie and Moine reported the use of an
enantiomerically enriched sulfoxide in the synthesis of chromane aldehyde 35 (Scheme 19). ${ }^{177}$

Scheme 19. Synthesis of chromane aldehyde 35 via an enantiomerically enriched sulfoxide.

Vinyl sulfoxide 69 was prepared in six steps ( $34 \%$ yield), and its addition to aldehyde 68 at $-78{ }^{\circ} \mathrm{C}$ provided the allylic alcohol as a single diastereoisomer. Heating in $\mathrm{NaOMe} / \mathrm{MeOH}$ at reflux temperature furnished the chromene compound 72 by $\mathrm{S}_{\mathrm{N}} 2$, ring closure, with no racemisation observed by ${ }^{1} \mathrm{H}$ NMR spectrometry using a chiral shift reagent. A further three steps (desulfurisation, benzylation and acetal hydrolysis) yielded ( $S$ )-aldehyde 35 in six steps from 68, with an overall yield of $28 \%$.

Uozumi et al. used palladium catalysis and a bisoxazoline (BOXAX) ligand to synthesise both chromane and dihydrobenzofuran structures with high e.e. (Scheme 20). ${ }^{178}$ The reaction was tolerant of various substituents around the phenol ring with e.e. values of $90-97 \%$ obtained under the optimised conditions. The ( $R, S, S$ ) diastereomer of the bisoxazoline ligand $\mathbf{7 4}$ gave poor selectivity ( $18 \%$ e.e.). Although a good $e . e$. of $97 \%$ was achieved for the chromane compound ( $\mathrm{n}=1$ ), with the $(S, S, S)$ ligand, high catalyst loading ( $25 \mathrm{~mol} \%$ ) was required and $25 \%$ of unreacted starting material was recovered even under these conditions.

Scheme 20. Asymmetric Wacker-type cyclisation.

Trost et al. examined the asymmetric $O$-alkylation of phenols as a route towards the synthesis of Canolides A and B, and the chromane core of vitamin E (Scheme 21). ${ }^{179}$ The aryl ether 79 was obtained with 98:2 regioselectivity and 77\% e.e., despite the tendency for phenols to attack the less hindered carbon in $\pi$-allylpalladium complexes. ${ }^{180}$ Hydroboration of the double bond, followed by activation as the tosylate which underwent spontaneous intramolecular alkylation, yielded the chromane $\mathbf{8 0}$ in an overall yield of $42 \%$ over three steps.

$\mathrm{R}^{1}=\mathrm{H}, \mathrm{R}^{2}=\mathrm{OH}:$ Calanolide A
$\mathrm{R}^{1}=\mathrm{OH}, \mathrm{R}^{2}=\mathrm{H}$ : Calanolide B

Scheme 21. Chromane synthesis using an asymmetric $O$-alkylation.

Trost et al. later improved on these moderate e.e. values by employing an intramolecular procedure (Scheme 22). ${ }^{181,182}$ Much improved e.e. values were obtained using this method and the issue of regioselectivity was also removed. This procedure also offered an improvement over similar work by Mizuguchi et al. and Labrosse et al. where only moderate e.e. values (up to 54\%) were obtained. ${ }^{183,184}$

Scheme 22. Intramolecular $O$-alkylation.

The leaving group was again chosen to be carbonate. Despite good e.e. values, the lengthy synthesis of the starting material $\mathbf{8 1}$ ( $13 \%$ over 11 steps) represents the biggest drawback to this procedure.

Tietze et al. used a Sharpless dihydroxylation and a palladium cross-coupling to synthesise the enantiomerically enriched chromane 92 (Scheme 23). ${ }^{185,186}$ Protection followed by dihydroxylation of the commercially available alcohol $\mathbf{8 4}$ provided diol 86 with an e.e. of $96 \%$, and a yield of $93 \%$. It was found that using a benzyl ether protecting group $(\mathrm{R}=\mathrm{Bn})$ gave a much lower e.e. of $53 \%$. Conversion to the iodide 89 was achieved over three steps, followed by coupling to aryl iodide $\mathbf{9 0}$ using $\mathrm{Zn} / \mathrm{Cu} / \mathrm{Pd}$ system.

Scheme 23. Synthesis of chromanes using a Sharpless dihydroxylation.

Conversion to the enantiomerically enriched chromane $\mathbf{9 2}$ from the acetonide $\mathbf{9 1}$ was previously reported. ${ }^{171}$ This work represents a slight improvement on earlier work by Tietze et al. where the dihydroxylation of an enyne was used to generate the same precursor acetonide 91, but with a lower e.e. of $84 \% .^{187}$ Takabe et al. and Mizuguchi et al. also applied asymmetric epoxidations and dihydroxylations of this type in the synthesis of enantiomerically enriched chromanes. ${ }^{188,189}$

### 1.9.3 Stereospedific Ring Closure Approadh

The majority of the syntheses discussed up to this point have involved the C-C coupling of side chain components to an enantiomerically enriched chromane.

Another important approach to vitamin E synthesis is by a stereospecific ring closure, where the desired stereochemistry is defined beforehand.

Due to their high selectivity, asymmetric epoxidation and dihydroxylation reactions have seen considerable use in natural product synthesis. ${ }^{190}$ Inoue et al. used a sulfoxide-mediated phenol alkylation and an asymmetric epoxidation in the total synthesis of $\alpha$-tocopherol. ${ }^{191}$ Phenoxy- and azasulfonium ylids such as $\mathbf{9 6}$ are known to undergo [2,3] sigmatropic rearrangements to yield $o$-alkylated products 97 (Scheme 24). ${ }^{192-194}$

Scheme 24. o-Alkylation of phenols with dialkyl sulphides.

Scheme 25 shows the synthesis carried out by Inoue et al. Epoxide $\mathbf{9 8}$ was obtained in enantiomerically pure form by the Sharpless epoxidation ${ }^{195}$ of the corresponding allylic alcohol, with the sulfide $\mathbf{1 0 0}$ generated over a further four transformations. Treatment of sulfide $\mathbf{1 0 0}$ with sulfuryl chloride, triethylamine and phenol $\mathbf{1 0 1}$ at $-40{ }^{\circ} \mathrm{C}$ yielded the alkylated compound 102 . The synthesis was completed by desulfurisation, reduction of the acetyl groups and acid-catalysed cyclisation as described by Cohen et al. ${ }^{196}$ The reported yield of $\alpha$-tocopherol was $81 \%$ from sulfide 99, with the $e . e$. at C-2 determined to be $96 \%$.

Scheme 25. Total synthesis of $\alpha$-tocopherol 1.

Takano et al. reported the synthesis of $\alpha$-tocopherol via an enantiomerically enriched 3-hydroxyacetylene (Scheme 26). ${ }^{197}$

Scheme 26. Synthesis of known benzoquinone intermediate 108.

The epoxide $\mathbf{9 8}$ was obtained from the Sharpless epoxidation of natural phytol. Takano et al. had previously shown that enantiomerically enriched chloroepoxides such as $\mathbf{1 0 4}$ could be converted into the corresponding 3-hydroxyacetylenes without racemisation. ${ }^{198}$ Thus, treatment of epoxide $\mathbf{1 0 4}$ with $n$-butyllithium furnished the propargyl alcohol 105. Cross-coupling with the aryl iodide 90 and subsequent
hydrogenation yielded alcohol 106, which was converted into the known pbenzoquinone 108. Completion of the synthesis from this compound was previously reported, ${ }^{191}$ and $\alpha$-tocopherol was obtained in nine steps and $24 \%$ overall yield from natural phytol.

Hübscher and Barner reported the synthesis of $\alpha$-tocopherol using several epoxide ring-opening reactions (Scheme 27). ${ }^{199}$ Diol 109 was obtained by the initial Sharpless epoxidation of 2-methylprop-2-en-1-ol, in $81 \%$ overall yield over two steps and $98 \%$ e.e. Treatment with NaH and alkyllithium $\mathbf{1 1 1}$ yielded the diol 112.

Scheme 27. Synthesis of $\alpha$-tocopherol 1 by Hübscher and Barner.

Activation of the primary alcohol by tosylation allowed the formation of epoxide 113, which was subsequently ring-opened by an enantiomerically enriched Grignard reagent. Completion of the synthesis from alcohol $\mathbf{1 0 7}$ was carried out using the method of Takano et al., ${ }^{197}$ to yield $\alpha$-tocopherol $\mathbf{1}$ in an overall yield of $17 \%$ over eight steps (from 2-methylprop-2-en-1-ol).

Woggon et al. employed a similar approach, where an epoxide ring opening was used to directly synthesise the chromane ring (Scheme 28). ${ }^{200}$

Scheme 28. Synthesis of $\alpha$-tocopherol using a stereoselective Shi epoxidation.

Alkene 114 was synthesised from trimethylhydroquinone and phytyl bromide using a four step sequence. Shi epoxidation gave the epoxide 115 in a d.e. of $97 \%$, where the bulky TBDPS (tert-butyldiphenylsilyl) protecting group was required to give good selectivity. Subsequent deprotection and cyclisation in $2 \mathrm{M} \mathrm{HCl} / \mathrm{Et}_{2} \mathrm{O}$ gave the chromane $\mathbf{1 1 7}$ in $\mathbf{9 3 \%}$ d.e. Note that the 6-exo-tet cyclisation is formally disfavoured according to Baldwin's rules, and the authors found that the 5-exo-tet benzofuran product was formed as a by-product in $19 \%$ yield. The slight decrease in d.e. is due to the extent of carbenium ion formation during the reaction. The chromane $\mathbf{1 1 7}$ was then converted into $\alpha$-tocopherol, with an overall yield of $20 \%$ over 11 steps.

Rein et al. reported a synthesis where the key steps were construction of a chromane ring by stereospecific ring closure, and an o-DPPB (o-diphenylphosphanyl benzoate) -directed syn substitution (Scheme 29). ${ }^{201}$ Synthesis of the chromane ring began with the coupling of aryl iodide $\mathbf{1 1 8}$ with alcohol 119, derived from an enzymatic hydrolysis. Subsequent hydrogenation yielded the acetonide $\mathbf{1 2 0}$ from which the conversion into chromane $\mathbf{6 1}$ had been described by Cohen et al. ${ }^{171,196} \mathrm{~A}$ further six steps furnished the iodide precursor 122. o-DPPB has been shown to act as a directing group in the addition of organic cuprates with excellent selectivity; furthermore, a single equivalent of organometallic reagent can be used in contrast to the two or more
equivalents commonly required. ${ }^{202}$ Thus, the Grignard reagent $\mathbf{1 2 3}$ was coupled to alkene $\mathbf{1 2 4}$ in syn fashion. Hydrogenation furnished $\alpha$-tocopherol in an overall yield of $\mathbf{3 0 \%}$ over 13 steps. The coupling fragment $\mathbf{1 2 4}$ was synthesised in ten steps with an overall yield of $18 \%$, where the stereochemistry was introduced by a rhodiumcatalysed hydroformylation reaction, with a d.e. of $91 \%$.

Scheme 29. $\alpha$-Tocopherol synthesis using a directed cuprate addition.

Woggon et al. used the Mitsunobu reaction with an $\alpha$-hydroxy ester to obtain the required stereochemistry at the C-2 position, and subsequent cyclisation yielded the chromane structure (Scheme 30). ${ }^{203}$

Epoxide $\mathbf{1 2 7}$ was prepared from the corresponding methylallyl alcohol by a Sharpless epoxidation protocol and treatment with EtMgCl . The key Mitsunobu reaction
between monoprotected hydroquinone $\mathbf{1 3 0}$ and $\alpha$-hydroxy ester $\mathbf{1 2 9}$ was achieved with $94 \%$ d.e. and complete inversion of configuration. Alcohol $\mathbf{1 3 3}$ was then obtained following olefination and rhodium-catalysed hydroboration. Oxidation to the aldehyde followed by acid-catalysed cyclisation yielded the chromene 135, which after hydrogenation and demethylation yielded $\alpha$-tocopherol $\mathbf{1}$ in a yield of $18 \%$ over 13 steps. The d.e. of the Mitsunobu reaction (94\%) was retained throughout the synthesis.

Scheme 30. $\alpha$-Tocopherol synthesis using a Mitsunobu reaction.

### 1.9.4 Stereoselective Ring Cosure Approach

In contrast to the syntheses discussed above, approaches to the synthesis of tocopherols where the chromane ring system is constructed in stereoselective fashion are relatively scarce. Tietze et al. used a palladium-catalysed cyclisation to yield chromanes $\mathbf{1 3 9}$ and $\mathbf{1 4 0}$ with good enantioselectivity (Scheme 31). ${ }^{204}$

Scheme 31. Synthesis of chromanes via palladium-catalysed cyclisation.

A proposed mechanism is shown in scheme 32 . The chirality is generated during the enantiofacial coordination of $\mathbf{1 3 6}$ to the palladium complex, where $\mathrm{L}_{\mathrm{n}}=(S, S, S)_{-}{ }^{i} \mathrm{Pr}-$ BOXAX. ${ }^{205,} 206$

Scheme 32. Domino Wacker-type oxidation and Heck reaction.

Insertion of acrylate $\mathbf{1 3 7}$ gave the chromane 139 in $84 \%$ yield and with an e.e. of $96 \%$; however, when $\mathrm{R}=\mathrm{CH}_{3}(\mathbf{1 3 8})$ the yield and e.e. of chromane 140 were $54 \%$ and $84 \%$ respectively. Dihydroxylation of the unsaturated ester 139 followed by oxidative cleavage with sodium periodate gave an aldehyde which could be converted into $\alpha$ tocopherol 1 by known methods. ${ }^{173}$

Woggon et al. employed a diastereoselective aldol/oxa-Michael addition reaction as the key step in the total synthesis of both $\left(2 R, 4^{\prime} R, 8^{\prime} R\right)-\alpha$-tocopherol and $\left(2 S, 4^{\prime} R, 8^{\prime} R\right)$ -$\alpha$-tocopherol (Scheme 33). ${ }^{207}$ Diarylprolinol-derived catalysts are known to provide good selectivity in a variety of addition reactions. ${ }^{208-211}$ Therefore, the reaction between aldehydes 144 and 145 , derived from trimethylhydroquinone and natural
phytol respectively, gave hemiacetal 147 in $58 \%$ yield and $97 \%$ d.e. A proposed mechanism is shown in scheme 34 . A number of proline derivatives were screened and $(R) /(S)-\mathbf{1 4 6}$ was found to give the best selectivity under the optimised conditions, although a fairly high catalyst loading ( $30 \mathrm{~mol} \%$ ) was required. The lactone $\mathbf{1 4 8}$ was readily hydrogenated to the carboxylic acid 149 , which could be converted into $\alpha$ tocopheryl methyl ether $\mathbf{1 5 0}$ using a Barton decarboxylation. ${ }^{212}$

Scheme 33. Synthesis of $\alpha$-tocopherol using a domino aldol/Michael addition.

Removal of the methyl ether protecting group using $\mathrm{BF}_{3} \cdot \mathrm{SMe}_{2} / \mathrm{AlCl}_{3}$ furnished ( $R, R, R$ )- $\alpha$-tocopherol and ( $S, R, R$ )- $\alpha$-tocopherol in yields of $29 \%$ and $26 \%$ respectively, over eight steps starting from phytol. Diastereomeric excess was measured at $93 \%$ and $94 \%$ respectively.

Scheme 34. Proposed mechanism for the aldol/oxa-Michael addition.

Woggon et al. also used chiral proline derivatives in a biomimetic synthesis inspired by a tocopherol cyclase enzyme (Schemes 35 and 36). ${ }^{213,214}$ The chiral auxiliary D-Pro-D-Asp was installed using a Mannich reaction with $N$-methylene-D-proline, followed by coupling with Fm-protected D-aspartate. Note that the use of a bulky R ${ }^{1}$ substituent was required to force the peptide into a conformation that is close enough to the C-8 double bond. The key cyclisation of amide $\mathbf{1 5 3}$ follows an analogous mechanism to that of the cyclase enzyme (Scheme 36). In this way the chromane 154 was furnished, which after removal of the chiral auxillary and the camphanate ester gave $\alpha$-tocotrienol in $65 \%$ e.e. Conditions developed by Pfaltz et al. ${ }^{165,215}$ enabled the catalytic hydrogenation of the side chain double bonds in an $R / S$ ratio of $>99: 1$, eventually yielding $\alpha$-tocopherol $\mathbf{1}$ in an overall yield of $1 \%$ over 16 steps.

Scheme 35. Biomimetic synthesis of $\alpha$-tocopherol 1.

Scheme 36. Reaction mechanism of tocopherol cyclase. ${ }^{213}$

An alternative approach was explored by Termath et al. where the Ni-catalysed 1,4addition of a methyl anion equivalent onto chromenone intermediate, 159, was anticipated to yield an enantiomerically enriched chromane when chiral ligands were employed (Scheme 37). ${ }^{216}$

Scheme 37. Synthesis of $\alpha$-tocopherol by 1,4-addition.

Acetophenone building block $\mathbf{1 5 5}$ was synthesised from trimethylhydroquinone in a yield of $85 \%$ over four steps, whilst carboxylic acid 156 was elaborated from $(R, R)$ hexahydrofarnesol in $96 \%$ yield. Treatment of ester 157 with KOt - Bu yielded the chromanone 158 in a Baker-Venkatamaran rearrangement, ${ }^{217,} 218$ and subsequent dehydration with $\mathrm{AcCl} / \mathrm{MeOH}$ gave the key chromenone 159. Termath et al. had previously reported work on metal-catalysed, enantioselective 1,4 -additions to cyclohexanone; ${ }^{219,} 220$ however, treatment of chromenone 159 with $\mathrm{AlMe}_{3}$ in the presence of a chiral Ni complex failed to provide any stereoselectivity. A maximum d.e. of $2 \%$ was observed across all the ligands screened. ( $2 R S, 4^{\prime} R, 8^{\prime} R$ )- $\alpha$-Tocopherol was obtained in an overall yield of $60 \%$ over 11 steps (longest linear sequence).

Colobert et al. synthesised ( $2 R, 4^{\prime} R S, 8^{\prime} R S$ )- $\alpha$-tocopherol using a sulfoxide-directed allylation as the key step (Scheme 38).

Scheme 38. Stereoselective synthesis of a chromane compound.

The treatment of the chroman-2-one 162 with the lithium anion of $(S)$ - $\mathbf{1 6 3}$ gave chromanol 164, which after reaction with trimethylorthoformate/p-toluenesulfonic acid $(p-\mathrm{TsOH})$ gave the corresponding ketal. Treatment of ketal 165 with $\mathrm{TiCl}_{4}$ and allyl trimethylsilane gave the sulfoxide $\mathbf{1 6 6}$ in $\mathbf{7 3 \%}$ yield and $>99 \%$ e.e. The proposed mechanism is shown in scheme 39. Attack of upper face of the oxonium intermediate by allyl trimethylsilane rationalises the observed stereochemistry. A cross-metathesis reaction with 166 and 3,7,11-trimethyldodec-1-ene gave a compound with the full carbon skeleton of $\alpha$-tocopherol, and a further three steps (desulfinylation, double bond hydrogenation and TBS deprotection) yielded ( $2 R, 4^{\prime} R S, 8^{\prime} R S$ )- $\alpha$-tocopherol 168 in ten steps and $24 \%$ overall yield.

Scheme 39. Sulfoxide-directed allylation.

### 1.10 Our Planned Synthesis of $\alpha$-Tocopherol

As a known precursor to $\alpha$-tocopherol, aldehyde $\mathbf{3 5}$ should be accessible from the carboxylic acid 169, which in turn should be the product of the intramolecular Jocic reaction of phenol 170 (Scheme 40). It was hoped that this phenol could ultimately be derived from the enantiomerically enriched $\beta$-lactone 171. Given the importance of the key cyclisation step in setting the stereochemistry of chroman-4-one 169, a detailed discussion of the Jocic reaction and the synthesis of trichlorocarbinols will follow.

Scheme 40. Preliminary retrosynthesis of $\alpha$-tocopherol 1.

### 1.11 The Jocic Reaction

The transformation of trichlorocarbinols $\mathbf{1 7 2}$ into $\alpha$-substituted carboxylic acids $\mathbf{1 7 3}$ under basic conditions is most commonly referred to in the literature as the Jocic reaction (Scheme 41). ${ }^{221,222}$

Scheme 41. The Jocic reaction.

The accepted mechanism is shown in scheme 42 . After deprotonation by base, the intramolecular displacement of chloride produces the gem-dichloroepoxide 174. The regioselective, stereospecific $\mathrm{S}_{\mathrm{N}} 2$ ring-opening of this epoxide by a nucleophile, followed by hydrolysis of the resulting acid chloride 175, yields $\alpha$-substituted carboxylic acids 173.

Scheme 42. General mechanism for the Jocic reaction.

The alkyl or aryl groups $\mathrm{R}^{1}$ and $\mathrm{R}^{2}$ can be widely varied and the reaction works with both organic and inorganic bases, in a variety of solvents. Many different nucleophiles have been employed and these will be discussed later.

### 1.12 The Bargellini Readion

The Bargellini reaction is a variation on the Jocic reaction where the trichlorocarbinol is not isolated but is generated in situ (Scheme 43). ${ }^{223}$

Scheme 43. General mechanism for the Bargellini reaction. $\mathrm{R}^{1}, \mathrm{R}^{2}=$ alkyl.

The mechanism goes through the same gem-dichloroepoxide $\mathbf{1 7 4}$ as the Jocic reaction, with the main differences being that the trichlorocarbinol is not isolated, and that neither $\mathrm{R}^{1}$ nor $\mathrm{R}^{2}$ are hydrogens. The reaction of aldehyde 177 with $\alpha-H$ fails to give carboxylic acid $\mathbf{1 7 8}$ under the same conditions due to competing aldol condensation reactions (Scheme 44). The reaction of aldehyde 177 with no $\alpha-\mathrm{H}$ yields mainly the alcohol and carboxylic acid products of the Cannizzaro ${ }^{224}$ reaction.

Scheme 44. Failure of aldehydes as substrates in the Bargellini reaction. $\mathrm{R}^{1}=$ alkyl.

Similarly to the Jocic reaction, a variety of bases and nucleophiles have been explored and the reaction has found considerable use by researchers in the pharmaceutical industry. Examples of the Jocic and Bargellini reactions will be discussed later.

### 1.13 Synthesis of Racemic Trichlorocarbinols

The synthesis of racemic trichlorocarbinols can largely be separated into two groups; the addition of a trichloromethyl anion to a carbonyl compound, or the addition of nucleophiles to chloral $\left(\mathrm{Cl}_{3} \mathrm{CCHO}\right)$ or related ketones. Examples of each are discussed in the following sections.

### 1.13.1 Trichloromethyl Anion Addition

One of the earliest examples of trichlorocarbinol synthesis via trichloromethide addition was from Willgerodt, who synthesised 1,1,1-trichloro-2-methylpropan-2-ol 180 in 1881 by the reaction of acetone with chloroform and sodium hydroxide (Scheme 45). ${ }^{225,}{ }^{226}$ Saljoughian et al. later reported that the optimal molar ratio of acetone:chloroform was $10: 1$, and that carrying out the reaction at $-5^{\circ} \mathrm{C}$ gave a yield of $71 \% .{ }^{227}$ The use KOH over NaOH gave higher yields.

Scheme 45. Early synthesis of 1,1,1-trichloro-2-methylpropan-2-ol. Yield not reported.

Jocic was the first to use this reaction with aldehydes under the same conditions to give trichlorocarbinols (Scheme 46). ${ }^{221}$ In addition to benzaldehyde 181 he also studied the reaction using isobutyraldehyde 183. However, it was found that significant aldol condensation took place and he was unable to isolate the trichlorocarbinol $\mathbf{1 8 4}$ cleanly.

Scheme 46. Synthesis of 2,2,2-trichloro-1-phenylethan-1-ol by Jocic.

This chloroform/hydroxide methodology was later extended to furfural 186 and $o$ chlorobenzaldehyde 187 by Howard (Scheme 47). ${ }^{228,229} \mathrm{He}$ also tested the reaction using aliphatic aldehydes (190, Scheme 48), but found that aldol condensation was prevalent as Jocic had reported previously. Howard also reported that bromoform could be used in place of chloroform to yield the tribromo compound. ${ }^{230}$

$$
\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHCH}_{2} .
$$

Both Howard and Jocic used less than equimolar quantities of hydroxide in their experiments since they assumed that it served as a catalyst for the reaction, which accounts partly for the low yields they obtained. Bergmann et al. used a series of substituted benzaldehydes with equimolar potassium hydroxide in order to obtain improved yields of the addition product (Scheme 49). ${ }^{231}$

Scheme 49. Improved synthesis of aryl trichlorocarbinols. $\mathrm{R}=o-\mathrm{CH}_{3}, m-\mathrm{CH}_{3}, p-\mathrm{CH}_{3}, o-\mathrm{OCH}_{3}, m$ $\mathrm{OCH}_{3}, p-\mathrm{OCH}_{3}, o-\mathrm{Cl}, m-\mathrm{Cl}, p-\mathrm{Cl}$.

Viehe and Valange used sodium amide as the base for the addition of trichloromethide to several carbonyl compounds (Table 7). ${ }^{232}$
carbonyl

Table 7. Synthesis of trichlorocarbinols using sodium amide base. Reagents and conditions: ${ }^{\text {a }} \mathrm{CHCl}_{3}$ (1.0 equiv.), $\mathrm{NaNH}_{2}$ (1.0 equiv.); ${ }^{\mathrm{b}} \mathrm{CHCl}_{3}$ (4.0 equiv.), $\mathrm{NaNH}_{2}$ (1.2 equiv.); ${ }^{\mathrm{c}} \mathrm{CHCl}_{3}$ (3.0 equiv.), $\mathrm{NaNH}_{2}$ (1.0 equiv.); ${ }^{\mathrm{d}} \mathrm{CHCl}_{3}$ ( 1.0 equiv.), $\mathrm{NaNH}_{2}$ ( 1.0 equiv.). All reactions were carried out in liquid ammonia solvent at $-80^{\circ} \mathrm{C}$.

These reaction conditions gave good yields for the ketones studied. When benzaldehyde was used a lower yield was obtained due to the competing addition of amide and the Cannizzaro side reaction.

Merz and Tomahogh used a phase transfer-catalysed reaction to synthesise trichlorocarbinols from both aldehydes and ketones (Table 8). ${ }^{233}$

| g | Cyclohexanone |  | 20 | 23 |

Table 8. Synthesis of trichlorocarbinols using a phase transfer catalyst.

Cannizzaro and aldol reactions are the major side reactions when strongly basic conditions are used in the presence of aldehydes. ${ }^{224,234}$ The use of biphasic conditions reduces the contact that the organic compounds have with the basic aqueous layer and this suppresses these side reactions. Even under these conditions the yield of aliphatic compound 195c was still low. Merz and Tomahogh put the unreactivity of 194e down to steric hindrance since the yields with cyclic analogues were higher. Additionally, it was found that a low temperature was necessary to obtain reasonable yields since at higher temperatures the Cannizzaro reaction predominated over addition of trichloromethide.

Wyvratt et al. developed a high yielding method for the synthesis of both secondary and tertiary trichlorocarbinols, with no evidence of competing Cannizzaro reactions (Scheme 50). ${ }^{235}$

Scheme 50. Wyvratt synthesis of 2,2,2-trichloro-1-(3-nitrophenyl)ethan-1-ol 197.

The base was used in a methanolic solution in order to obtain a homogenous mixture, since lower yields were obtained with solid base in DMF alone. In addition to 3nitrobenzaldehyde 197, benzaldehyde (99\%), p-anisaldehyde (97\%), isobutyraldehyde (70\%) and cyclohexanone (68\%) were also used as substrates in the reaction. The lower yields obtained for the enolisable carbonyl compounds is due to the competing aldol condensation. Wyvratt attributed the success of the procedure to the enhanced nucleophicity of the trichloromethyl anion in DMF solvent.

Aggarwal and Mereu developed an amidine-promoted protocol for the addition of chloroform to benzaldehyde (Scheme 51). ${ }^{236}$

Scheme 51. 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU)-promoted addition of chloroform to benzaldehyde.

Both amidines and guanidines were found to promote the reaction; the use of these non-nucleophilic organic bases completely suppressed any Cannizzaro side reactions. Table 9 shows a selection of results obtained by Aggarwal. Noteworthy is the observation that enolisable aldehydes and ketones (entries $\mathbf{e}-\mathbf{g}$ ) gave better yields than had previously been reported. This is due to competing side reactions being suppressed by the mild conditions. The yield for mesitaldehyde (entry $\mathbf{d}$ ) is lower due to steric hindrance.

| entry | carbonyl compound | time (h) | trichlorocarbinol yield (\%) |
| :---: | :---: | :---: | :---: |
| a | Benzaldehyde | 3 | 98 |
| b | $o$-Chlorobenzaldehyde | 4 | 94 |

| e | Propanal | 2 | 80 |
| f | Acetone | 24 | 75 |
| g | Cyclohexanone | 24 | 84 |

Table 9. Selection of results from Aggarwal et al. Reactions were performed in absence of solvent at room temperature using a carbonyl compound: $\mathrm{CHCl}_{3}: \mathrm{DBU}$ ratio of 1:2:1.

Snowden et al. developed a one-pot synthesis of trichlorocarbinols from primary alcohols (Table 10). ${ }^{237}$ By sequential addition of Dess-Martin periodinane (DMP) and 1,5,7-triazabicyclo[4.4.0]dec-5-ene (TBD) to the alcohol in $\mathrm{CHCl}_{3}$, trichlorocarbinols 200 were synthesised in reasonable to good yield. 1,1,3,3-Tetramethylguanidine (TMG) and DBU gave inferior results when used as the base. By removing the need to isolate the aldehyde 199 the authors were able to trichloromethylate more sensitive compounds, such as 2-thienylmethanol 198f, which formed a sensitive aldehyde that proved difficult to isolate and trichloromethylate by other methods. Propargylic alcohol 198g was an unsuitable substrate since several byproducts were formed upon addition of base to the intermediate ynal.

Table 10. One-pot oxidation/trichloromethylation of primary alcohols. Reactions were conducted on a 1 mmol scale.

Li et al. used an organotitanium reagent to prepare trichlorocarbinols from enolisable ketones (Table 11). ${ }^{238}$ Enolisation and steric hindrance remain problems in the preparation of trichlorocarbinols from carbonyl compounds with $\alpha$-protons. In searching for a solution to this issue, Li et al. noted that organotitanium reagents had been shown to be superior to traditional Grignard reagents for additions to sterically hindered and/or enolisable ketones. ${ }^{239,}{ }^{240}$ Thus, when $\mathrm{TiCl}(\mathrm{O} i-\mathrm{Pr})_{3}$ was used as an additive in the base-promoted addition of chloroform, a range of ketones were found to be suitable substrates. Notably, the highly enolisable ketone 201c gave trichlorocarbinol 202c in moderate yield.

| carbonyl |  <br> 201a-e <br> product | i) $\mathrm{TiCl}(\mathrm{Oi}-\mathrm{Pr})_{3}, \mathrm{CHCl}_{3}$, THF <br> ii) $n$-BuLi |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |
|  |  | yield (\%) | carbonyl | product | yield (\%) |
|  <br> a <br> b |  95 93 |  |  <br> d |  | 84 |
|  |  |  |  <br> e |  | $96$ |
|  <br> c |  |  |  |  |  |

Table 11. Reagents and conditions: $\mathrm{CHCl}_{3}$ (5.0 equiv.), $n-\mathrm{BuLi}$ (5.0 equiv.), $\mathrm{TiCl}(\mathrm{O} i-\mathrm{Pr})_{3}$ ( 2.0 equiv.), THF, $-60^{\circ} \mathrm{C}, 4 \mathrm{~h}$.

Organometallic reagents of the type $\mathrm{LiH}_{2} \mathrm{X}, \mathrm{LiHX}_{2}$ and $\mathrm{LiX}_{3}$ are known to add to electrophiles; however they are highly thermolabile and their reactions require low temperatures. ${ }^{241-245} \alpha$-Halo organosilanes were investigated by Hiyama and Fujita as an alternative method for generating halo-carbanions for use in organic synthesis (Table 12). ${ }^{246}$ Treatment of the organosilane 203 with tris(dimethylamino)sulfonium difluorotrimethylsilicate (TASF) generated the corresponding carbanion, which readily added to aldehydes. When 2-phenylpropanal was used as the aldehyde (Table 12 , entry $\mathbf{c}$ ) the major product was the $(2 S, 3 R)$-diastereomer. The use of more bulky organosilanes (e.g $\mathrm{R}=\mathrm{PhMe}_{2}$ or $t$ - $\mathrm{BuMe}_{2}$ ) did not significantly alter this ratio, indicating that the selectivity arises from the "naked" trichlorocarbanion.

Table 12. ${ }^{\text {a }}$ Isolated after desilylation ( $1 \mathrm{M} \mathrm{HCl} / \mathrm{MeOH}, \mathrm{rt}, 0.25-0.5 \mathrm{~h}$ ). Reagents and conditions: ${ }^{\mathrm{b}}$ TASF ( 0.1 equiv.), THF, $\mathrm{rt}, 8 \mathrm{~h} ;{ }^{\mathrm{c}}$ TASF ( 0.1 equiv.), THF, $0^{\circ} \mathrm{C}, 12 \mathrm{~h} ;{ }^{\mathrm{d}}$ TASF ( 0.25 equiv.), THF, 0 ${ }^{\circ} \mathrm{C}, 4 \mathrm{~h}$. In all entries 1.2 equiv. of silane was used. TASF $=$ tris(dimethylamino)sulfonium difluorotrimethylsilicate.

Scheme 52. Explanation for the observed selectivity using a Felkin-Anh model.

Although the TMS-CCl ${ }_{3}$ reagent had been shown above to add to aldehydes in useful yields, and later extended to ketones by Fujita et al., ${ }^{247}$ syntheses of the reagent itself were generally low yielding; ${ }^{248-250}$ although more recently yields of $65-70 \%$ have been reported. ${ }^{251}$ The reaction of TMS- $\mathrm{CCl}_{3}$ with electrophiles has also been catalysed by sodium formate ${ }^{252}$ and by flash pyrolysis. ${ }^{253}$ Trimethylsilyl trichloroacetate has also been used as a transfer agent. ${ }^{254,255}$

During scale-up studies Henegar and Lira developed a protocol for in situ generation of TMS-CCl ${ }_{3}$ and addition to carbonyl compounds, thus avoiding the need to isolate and handle the reagent (Table 13). ${ }^{256}$
entry

Table 13. ${ }^{\text {a }}$ Isolated as a $>20: 1$ mixture of diastereoisomers. ${ }^{\text {b }}$ Not isolated, the deprotected carbinol was obtained in a yield of $65 \%$ over two steps and as a $>20: 1$ mixture of diastereoisomers.

The reaction was successful with a range of carbonyl compounds. Notably, high diastereoselectivity was obtained for entries $\mathbf{d}$ and $\mathbf{e}$, where for 207d the addition of

TMS-CCl ${ }_{3}$ was established to occur trans to the substituent on the ring. Compounds which readily enolised (entries $\mathbf{c}$ and $\mathbf{g}$ ) gave lower yields.

Whilst studying the thermal decarboxylation of trichloroacetate salts to generate dichlorocarbenes, Wagner et al. found that when acetone or butanone were used as the solvent addition of $\mathrm{CCl}_{3}$ anion occurred, according to Scheme 53. ${ }^{257,} 258$

Scheme 53. Addition of trichloromethyl anion to acetone via decarboxylation of trichloroacetate salts.

Winston et al. noted this observation and used the same conditions to prepare the trichlorocarbinol 210 in reasonable yield (Scheme 54). ${ }^{259,} 260$ This appears to be the first reported attempt to use the thermal decarboxylation of trichloroacetate as a deliberate method for introducing the trichloromethyl group into organic structures.

Scheme 54. Synthesis of trichloromethylhydroxy lactone 210.

Corey and Link further developed a general synthesis of trichlorocarbinols from aldehydes (Table 14). ${ }^{261}$ By avoiding the use of a strong base, neither Cannizzaro nor aldol reaction side products were observed, as shown by the high yields obtained from aldehydes containing $\alpha$-protons (entries $\mathbf{a}, \mathbf{c}, \mathbf{e}$ and $\mathbf{f}$ ). Mild conditions and simplicity have allowed this procedure to find wide use for the synthesis of trichlorocarbinols, as will be seen later in the chapter.

Table 14. Reactions were run at $23^{\circ} \mathrm{C}$ (entries a-d) or $4{ }^{\circ} \mathrm{C}$ (entries $\mathbf{e}$ and $\mathbf{f}$ ). TCA $=$ trichloroacetic acid; $\mathrm{NaTCA}=$ sodium trichloroacetate.

### 1.13.2 Nudeophilic Addition to Chloral

The addition of nucleophiles to chloral to yield trichlorocarbinols considerably predates trichloromethide addition to carbonyl compounds; as early as 1858 ammonia had been used to yield the amino alcohol by Staedeler. ${ }^{262}$ The first example of a carbon-based nucleophile being used in this way is from Garzarolli, who reported the reaction of diethyl zinc with chloral to yield 1,1,1-trichlorobutan-2-ol 214 (Scheme 55). ${ }^{263}$

Scheme 55. Reaction of chloral with diethyl zinc.

Jocic first used the reaction of phenylmagnesium bromide with chloral to give 2,2,2-trichloro-1-phenylethan-1-ol 215 (Scheme 56). ${ }^{222}$ A yield of $61 \%$ was obtained by

Riemschneider for the same reaction. ${ }^{264}$ Kharasch et al. obtained a yield of $60 \%$ for the reaction of methylmagnesium bromide with chloral. ${ }^{265}$

Scheme 56. Grignard reagent addition to chloral. $\mathrm{R}=\mathrm{Ph}, \mathrm{Me}$.

A range of different Grignard reagents were studied by Howard (Table 15). ${ }^{266,} 267$

|  | $\xrightarrow[\text { reflux, } 2 \mathrm{~h}]{\mathrm{RMgX}, \mathrm{Et}_{2} \mathrm{O}}$ |  |

| b | Butyl | 41 |
| c | $i$-Propyl | 41 |
| d | Benzyl | 19 |

Table 15. Reaction of chloral with Grignard reagents.

Yields for the reaction of chloral with Grignard reagents that contain $\beta$-hydrogens are typically lower due to oxidation of the reagent, yielding significant quantities of reduced chloral (trichloroethanol). ${ }^{268}$ An expanded range of Grignard reagents have since been explored by other authors and were found to give reasonable yields. ${ }^{269-271}$ When aryl trichlorocarbinols are required, Friedel-Crafts procedures are useful. The earliest reports, dating back to 1887 , detail the reaction of benzene and chloral in the presence of $\mathrm{AlCl}_{3}$, to yield 2,2,2-trichloro-1-phenylethan-1-ol. ${ }^{272,273}$ Dinesmann demonstrated the generality of the reaction by using toluene, $p$-xylene and anisole as
the aromatic starting materials. ${ }^{274} \mathrm{AlCl}_{3}$ is generally used as the Lewis acid catalyst but $\mathrm{BF}_{3}$ has also been shown to be effective. ${ }^{275}$ When sulfuric acid is used as the catalyst the products are exclusively diaryltrichloroethanes. ${ }^{276}$

Reeve et al. studied a variety of aromatic compounds in the Friedel-Crafts reaction with chloral (Table 16). ${ }^{277}$

|  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| i | Bromobenzene | Excess ${ }^{\text {a }}$ | 0.2 | Bromobenzene | 55 |
| j | Iodobenzene | 1.0 | 1.0 | $\mathrm{CS}_{2}$ | 30 |

Table 16. Friedel-Crafts reaction of aromatic compounds with chloral. ${ }^{\text {a }}$ Excess indicates that 7-10 equivalents were employed.

In general, the aromatic compound was used as both reactant and solvent. When $\mathrm{CS}_{2}$ was used as the solvent a complex of aryltrichlorocarbinol/ $\mathrm{AlCl}_{3}$ precipitated out of solution, so a stoichiometric quantity of $\mathrm{AlCl}_{3}$ was required for these reactions. The molar equivalents of $\mathrm{AlCl}_{3}$ required varies with the reactivity of the aromatic substrate.

Rezende et al. established that the optimum equivalent of $\mathrm{AlCl}_{3}$ was 0.2 for substrates less reactive than benzene and 0.4 for substrates more reactive than benzene. ${ }^{278}$

Much like the Friedel-Crafts acylation reaction has found use in the synthesis of aryl trichlorocarbinols, the aldol reaction can be used to synthesise alkyl trichlorocarbinols. An early example of this from Koenigs in 1892 is shown in scheme $57 .{ }^{279}$

Scheme 57. Aldol condensation of acetone and acetophenone with chloral.

Note that the reaction stops after the addition of one chloral molecule. Similar results were reported when the reactions were carried out in the absence of solvent. ${ }^{280}$

Reeve studied the condensation of a further four methyl ketones with chloral (Table 17). ${ }^{281}$ This study was undertaken partly to resolve discrepancies in the literature as to the regiochemistry of the aldol adduct from 221b. Breusche and Keskin ${ }^{282,283}$ stated that condensation occurred at the methyl group, while Caujolle et al. believed that condensation occurred at the methylene group. ${ }^{284}$ Reeve et al. confirmed that addition occurred at the methyl group of 221b, indicating that the enol formation was kinetically controlled. Steric hindrance is also a factor since butanone undergoes reaction at both methylene and methyl sites. ${ }^{285}$

| entry | $\mathbf{R}^{\mathbf{1}}$ | $\mathbf{R}^{\mathbf{2}} \mathbf{C O}_{2} \mathbf{N a}$ (equiv.) | temperature $\left({ }^{\circ} \mathbf{C}\right)$ | time (h) | $\mathbf{2 2 2}$ yield (\%) |

Table 17. Ketones were used in slight excess (1.25 equiv.) with respect to chloral. $\mathrm{R}^{2}=\mathrm{C}_{2} \mathrm{H}_{5}$ (entries $\mathbf{b}$ and $\mathbf{c}$ ); $\mathrm{R}^{2}=\mathrm{CH}_{3}$ (entries $\mathbf{a}$ and $\mathbf{d}$ ).

Banno et al. used $\mathrm{TiCl}_{4}$ to mediate the aldol reaction between silyl enol ether $\mathbf{2 2 3}$ and chloral (Scheme 58). ${ }^{286,287}$ The reaction was rapid and high yielding even at $-78{ }^{\circ} \mathrm{C}$, and no byproducts from poly- or self-condensation were detected.

Scheme 58. Crossed-aldol reaction using a silyl enol ether

Jiang et al. used $\mathrm{ZnCl}_{2} / \mathrm{NEt}_{3}$ to promote the alkynation of both chloral and bromal (Scheme 59). ${ }^{288}$

Scheme 59. Reagents and conditions: alkyne 225 (1.1 equiv.), $\mathrm{Cl}_{3} \mathrm{CCHO}$ (1.0 equiv.), $\mathrm{ZnCl}_{2}$ (1.5 equiv.), $\mathrm{NEt}_{3}$ (1.5 equiv.).

### 1.14 Synthesis of Enantiomerically Enridhed Tridhlorocarbinols

Considerable effort has gone into the asymmetric syntheses of trichlorocarbinols due to the stereospecific nature of their reaction with nucleophiles under basic conditions (see earlier, Scheme 41). An early example from Casiraghi et al. is shown in table 18. ${ }^{289,290}$

Table 18. $\mathrm{R}^{2}=(-)$-menthyl. Alkoxide 229 was prepared in situ from phenol (1.0 equiv.), (-)-menthol (1.0 equiv.) and $\mathrm{Et}_{2} \mathrm{AlCl}$ (1.0 equiv.). ${ }^{\mathrm{a}}$ Not determined.

The authors used a chiral alkoxyaluminium chloride promoter in the $o$-alkylation of phenols 228a-e. Presumably coordination of chloral to the phenoxy-aluminium complex 229 in the reaction transition state provides the asymmetric induction, although the e.e. values obtained were variable. Stoichiometric quantities of aluminium reagent were also required.

Yamamoto et al. disclosed the first asymmetric ene-reaction catalysed by the chiral Lewis acid ( $R$ )-232 (Table 19). ${ }^{291}$ The enantiomeric excesses obtained were fairly low, and stoichiometric quantities of Lewis acid catalyst were required to maximise the e.e.
values. A chiral poisoning strategy has also been used to yield a catalyst for the asymmetric ene reaction with chloral, albeit with lower e.e. than those in the examples above. ${ }^{292}$

Table 19. Reagents and conditions: ${ }^{\text {a }}(R)-\mathbf{2 3 2}$ ( 0.2 equiv.), $4 \AA$ molecular sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}, 1.5$ $\mathrm{h} ;{ }^{\mathrm{b}}(R)$-232 (1.1 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 1 \mathrm{~h} ;{ }^{\mathrm{c}}(R)$-232 (1.1 equiv.), $-78^{\circ} \mathrm{C}, 1-2 \mathrm{~h}$. All reactions were carried out with the alkene in slight excess (1.2 equiv.).

Jiang et al. reported the catalytic, asymmetric alkynation of chloral to yield propargylic alcohols 236 (Table 20). ${ }^{293}$ Carreira and co-workers had previously reported the first catalytic, asymmetric addition of terminal acetylenes to aldehydes using $\mathrm{Zn}(\mathrm{OTf})_{2}$, (+)- or (-)-N-methylephedrine and $\mathrm{NEt}_{3} .{ }^{294-297}$ Jiang et al. expanded on this work and studied the reaction of a variety of acetylenes $\mathbf{2 3 4}$ with chloral. Ligand ( $S, S$ )-235 was found to provide greater selectivity than $N$-methylephedrine used by Carreira. In addition, the ligand could be recovered unchanged in $96 \%$ yield and recycled without loss of enantioselectivity.

Table 20. Reagents and conditions: alkyne ( 1.1 equiv.), $\mathrm{Zn}(\mathrm{OTf})_{2}$ ( 0.50 equiv.), $\mathrm{NEt}_{3}$ ( 0.75 equiv.), $(S, S)$-235 ( 0.55 equiv.). All reactions were carried out in toluene at room temperature.

### 1.14.1 Asymmetric Reduction

Corey and co-workers reported the highly enantioselective borane reduction of ketones, catalysed by chiral oxazaborolidines. ${ }^{298-301}$ They applied this method to trichloroketones 237 (Table 21), ${ }^{302}$ which were readily synthesised in two steps from the corresponding aldehydes. ${ }^{261,303}$ Excellent enantioselectivities were achieved for all the ketone substrates screened, although low temperatures were necessary to maximise the e.e. values (entries $\mathbf{f}$ and $\mathbf{g}$ ).

Table 21. All reactions were initiated at $-78^{\circ} \mathrm{C}$ and brought to the indicated temperature after one hour.

Enantioselective reductions of this type have also been carried out using stoichiometric pinene-derived boranes in place of the oxazaborolidine 239, although the reactions with trichloroketones were extremely slow (22 days to reach completion). ${ }^{304,305}$

Noyori first introduced the ruthenium catalyst $(R, R) \mathbf{- 2 4 1}$ for the asymmetric transfer hydrogenation of acetophenones ${ }^{162,306,307}$ and Wills later improved the catalytic activity of the reaction by developing the tethered analogue $(R, R)-\mathbf{2 4 2} .{ }^{308,309}$ Perryman et al. reported the reduction of trichloroketones $\mathbf{2 4 3}$ using both of these catalysts (Scheme 58). ${ }^{310}$ High enantioselectivities were obtained for a variety of alkyl trichloroketones, however when $\mathrm{R}=$ aryl the selectivity was reduced due to competition between Ar and $\mathrm{CCl}_{3}$ for coordination to the arene ligand. This is
exemplified by the fact that the $2,2,2$-trichloroacetophenone was reduced with the opposite sense of asymmetric induction compared to acetophenone itself, albeit with lower e.e. The difference in e.e. values obtained from using tethered catalyst $(R, R)$ 242 was typically small.

Scheme 60. Yields and enantiomeric excesses of trichloroketone reductions. Typical conditions: ketone ( 1.0 mmol ), $\mathrm{HCO}_{2} \mathrm{H} / \mathrm{NEt}_{3}(5: 2,0.5 \mathrm{~mL})$, under $\mathrm{N}_{2}, 28^{\circ} \mathrm{C}, 5-17 \mathrm{~h}$. All results shown were obtained using catalyst $(R, R)-\mathbf{2 4 1}$.

### 1.14.2 Organocatalysis

Although not catalytic, Funabiki et al. used chiral imines in a stereoselective aldol reaction with chloral to yield enantiomerically enriched $\beta$-trichloro- $\beta$-hydroxy ketones (Table 22). ${ }^{311}$ Yields were moderate in comparison to other methods although the e.e. values were good. The reaction was also successful when chloral hydrate was used in place of chloral, with slightly worse enantioselectivity.

|  $\begin{equation*} \mathrm{Cl}_{3} \tag{To} \end{equation*}$ <br> (R)-245a-f |  | $\mathrm{Cl}_{3} \mathrm{CCHO}$ <br> Toluene, $-78^{\circ} \mathrm{C}$ to rt <br> Overnight <br> (R)-246a-f |  |

Table 22. Reagents and conditions: chloral (1.0 equiv.), toluene, $-78^{\circ} \mathrm{C}$ to rt , overnight.

Yamamoto et al. reported an asymmetric, direct aldol reaction promoted by a prolinederived tetrazole catalyst (Table 23). ${ }^{312}$ List and co-workers were the first to report proline as an effective asymmetric organic catalyst, which they used in several classes of reaction. ${ }^{313-316}$ Yamamoto et al. used the proline-derived catalyst $\mathbf{2 4 8}$ to catalyse the aldol reaction of ketones 247a-g with either chloral or chloral hydrate, and a high enantioselectivity was observed. This was the first example of an organocatalysed aldol reaction with a water-sensitive aldehyde component, and catalyst 248 was generally found to be more effective than proline alone.

| entry | R | temp, ${ }^{\circ} \mathbf{C}($ time, $\mathbf{h})$ | $\mathbf{2 4 9}$ yield (\%) | e.e. (\%) ${ }^{\text {a }}$ |

Table 23. Reagents and conditions: ketone (2.0 equiv.), $\mathbf{2 4 8}$ ( $5 \mathrm{~mol} \%$ ), $\mathrm{CH}_{3} \mathrm{CN} .{ }^{\text {a }}$ The absolute configurations were not determined except for entry $\mathbf{e} .{ }^{b}$ Chloral was used in place of its monohydrate. Gong et al. reported the first example of the cross-aldol reaction of chloral with aliphatic aldehydes (Table 24). ${ }^{317}$ When $L$-proline was used as the catalyst, considerable self-condensation of aldehyde $\mathbf{2 5 0}$ was observed. The diastereo- and enantioselectivities were generally poor and a limited number of aliphatic aldehyde substrates were screened. In addition, a high catalyst loading of $30 \mathrm{~mol} \%$ was required. The authors screened $L$-proline in their reaction conditions but not catalyst 248, despite it having been shown to be highly effective.

| entry |  |  $\frac{\mathrm{Cl}_{3}}{\mathrm{CH}}$ <br> 250a-d | -prolinamide |  <br> 251a-d |  |

Table 24. Reagents and conditions: $\mathrm{Cl}_{3} \mathrm{CCHO}$ (1.0 equiv.), $L$-prolinamide ( 0.30 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt , 24 h.
$\beta$-Lactones are masked aldol units, after ring opening by a suitable nucleophile. Wynberg et al. reported the first synthesis of enantiomerically enriched lactones 254, via a cinchona alkaloid-catalysed aldol lactonisation (Table 25)..$^{318-320}$ These lactones had previously only been synthesised in racemic form. ${ }^{321,322}$ The general catalytic cycle of the reaction is shown in scheme 61. Zwitterions such as $\mathbf{2 5 7}$ have been shown to have a relatively long lifetime, ${ }^{323}$ providing the stereoselectivity when chiral tertiary amines (such as quinidine and quinine) are used.

In general, much better enantioselectivities were obtained when using quinidine (255) as the catalyst. The reason for the difference in selectivity between quinine and quinidine is unclear, although it must be based on the relative position of the vinyl group in the transition states. Sufficient polarisation of the carbonyl is necessary for the reaction to take place. For example, no reaction was observed with monochlorinated aldehydes or with trichloroacetophenone (entry g). However, with para- electron withdrawing groups on the aromatic ring (entries $\mathbf{h}$ and $\mathbf{i}$ ) the $\beta$-lactone was successfully isolated.

Table 25. Catalytic, asymmetric synthesis of 2-oxetanones. ${ }^{\text {a }}$ Identified as the $(R)$-enantiomer by conversion to malic acid. ${ }^{\mathrm{b}}$ The yield using quinine as the catalyst was not reported.

Scheme 61. Catalytic cycle for the tertiary amine-catalysed aldol lactonisation of ketene $\mathbf{2 5 2}$ with chloral.

Despite good e.e. values and high isolated yields, the need to use a ketene generator remained a limitation in Wynberg's protocol. Romo et al. used in situ-generated ketene to synthesise a number of chlorinated $\beta$-lactones (Scheme 62). ${ }^{324}$

e.e. not determined.

Scheme 62. The absolute configuration of $\mathbf{2 5 9 b}$ and 171 were confirmed as $(R)$ by comparison of optical rotations to literature data. ${ }^{319,320}$ The remaining lactones were assumed to be of the same configuration.

Treatment of acetyl chloride with Hunig's base ( $i-\mathrm{Pr}_{2} \mathrm{NEt}$ ) generated the required ketene $\mathbf{2 5 2}$ by in situ dehydrochlorination, which then took part in the reaction with the aldehydes 258. The tertiary amine used as a base has the potential to act as the nucleophilic catalyst, thus leading to racemisation; however the high e.e. values obtained, combined with the greater nucleophicity of the quinuclidine $N$-atom over Hunig's base, ${ }^{323,325}$ suggest that this does not take place.

### 1.15Jocic Readions with Racemic Tridhlorocarbinols

### 1.15.1 Reactions with Oxygen-based Nudeophiles

Much of the early work on Jocic reactions involved the reaction of trichlorocarbinols 260, with base in alcoholic solution to yield the $\alpha$-alkoxy carboxylic acids 263 (Scheme 63). The reaction mechanism depicted is believed to be general regardless of the nature of the nucleophile, and support for the gem-dichloroepoxide intermediate comes both from the high stereospecificity of the reaction (discussed later) and from the isolation of pentachloro-propylene oxide 261 (where $\mathrm{R}^{1}=\mathrm{CCl}_{3}, \mathrm{R}^{2}=\mathrm{H}$ ). ${ }^{326}$ More recently, the dichloroepoxide 264 was isolated and characterised by X-ray crystallography. ${ }^{327}$

Scheme 63. General Jocic reaction mechanism, depicted with an alkoxide nucleophile.

Table 26 lists some $\alpha$-alkoxy carboxylic acids synthesised by Bergmann et al. ${ }^{328}$ The use of more bulky substrates and nucleophiles gave lower yields as would be expected.

Bergmann et al. later found that aryl trichlorocarbinols $\left(\mathrm{R}^{1}=\mathrm{Ar}, \mathrm{R}^{2}=\mathrm{H}\right)$ underwent the same reaction under these conditions. ${ }^{231}$

| entry | $\mathbf{R}^{1}$ | $\mathbf{R}^{2}$ | $\mathbf{R}^{3}$ | 263 yield (\%) |
| :---: | :---: | :---: | :---: | :---: |

| $\mathbf{c}$ | $\mathrm{CH}_{3}$ | $\mathrm{CH}_{3}$ | $i$-Propyl | 44 |
| $\mathbf{d}$ | $\mathrm{CH}_{3}$ | $\mathrm{CH}_{3}$ | $i$-Butyl | 75 |
| $\mathbf{e}$ | $\mathrm{CH}_{3}$ | Ethyl | $i$-Butyl | 62 |
| $\mathbf{f}$ |  | $-\left(\mathrm{CH}_{2}\right)_{5}-$ | $i$-Butyl | 61 |

Table 26. Synthesis of $\alpha$-alkoxy carboxylic acids. Reagents and conditions: KOH (4.0 equiv.), $\mathrm{R}^{3} \mathrm{OH}$, rt to reflux, 3 h .

Reeve et al. later reported an improved synthesis of $\alpha$-methoxyaryl acetic acids 266 using in situ trihalocarbinols (Scheme 64). ${ }^{329-331}$ By removing the need to isolate the trihalocarbinols, the overall yields were improved and the reaction was successful for a variety of aryl aldehydes with either chloroform or bromoform.

Scheme 64. Synthesis of $\alpha$-methoxyaryl acetic acids.

Scheme 65. Synthesis of $\alpha$-methoxyaliphatic acetic acids. $R=$ alkyl.

Under the conditions shown in scheme 64, aliphatic aldehydes undergo considerable aldol self-condensation. Using an inverse addition technique, Compere et al. were able
to suppress aldol side reactions and synthesise a range of $\alpha$-methoxyaliphatic acetic acids (Scheme 65). ${ }^{332}$ The acids 268 were isolated in yields of $24-63 \%$ after purification.

The first example of a Jocic reaction using a phenoxide nucleophile with an isolated trichlorocarbinol appears to be from Korger in 1963 (Scheme 66). ${ }^{333}$

Scheme 66. $\mathrm{R}^{1}=\mathrm{CH}_{3}, \mathrm{C}_{2} \mathrm{H}_{5} ; \mathrm{R}^{2}=\mathrm{H}, \mathrm{OBn} ; \mathrm{X}=\mathrm{H}, \mathrm{Cl}, \mathrm{Br}$.

The reaction was part of a synthesis towards analogues of Griseofulvin 272. ${ }^{334}$ Corey used the reaction of $\mathbf{2 7 3}$ and $\mathbf{2 7 4}$ with "chloretone" $\mathbf{1 8 0}$, to yield $\alpha$-phenoxy acids 275 and 276 (Scheme 67). ${ }^{335}$

Scheme 67. Reagents and conditions: phenol ( 2.0 equiv.), NaOH ( 8.0 equiv.), acetone, rt, 16 h .

Fechtel et al. studied a wider range of phenols in the reaction with trichlorocarbinol 277 (Table 27). ${ }^{336}$

Table 27. Phenoxide 278 was generated in situ by the addition of substituted phenol (1.02 equiv.) to sodium in dry methanol.

The authors found that electron-donating groups on the phenol provided higher yields, whilst the opposite was true for electron-withdrawing groups. This is due to the increased or decreased electron density of the phenoxide ion, respectively. It would be expected that methoxide (from the solvent) might compete with phenoxide as a nucleophile. However, an excess of phenol compared to base diminishes the concentration of methoxide ions in solution. In addition to the procedure shown above, Fechtel et al. also carried out the reaction in a $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ solvent system to yield the corresponding acids in comparable yields.

Snowden et al. developed an approach to $\alpha$ - or $\gamma$-substituted enoic acids (Scheme 68). ${ }^{337}$ The authors employed several oxygen-based nucelophiles in the Jocic reaction of alkenyl trichlorocarbinols $\mathbf{2 8 0}$, and a selection of their results are shown in table 28.

Scheme 68. Reaction of alkenyl trichlorocarbinols with various nucleophiles.

| entry | $\mathbf{R}$ | solvent | $\mathbf{X}$ | $\mathbf{2 8 1 : 2 8 2}$ | major regioisomer yield (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{a}$ | $n-\mathrm{C}_{5} \mathrm{H}_{11}$ | $\mathrm{DME} / \mathrm{MeOH}$ | OMe | $5: 1$ | 81 |
| $\mathbf{b}$ | $n-\mathrm{C}_{5} \mathrm{H}_{11}$ | $\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}$ | OH | $1: 2$ | 64 |
| $\mathbf{c}$ | $n-\mathrm{C}_{5} \mathrm{H}_{11}$ | Allyl alcohol | OAllyl | $>20: 1$ | 93 |
| $\mathbf{d}$ | Ph | DME/MeOH | OMe | $2.5: 1$ | 47 |
| e | Ph | Allyl alcohol | OAllyl | -a | - |

Table 28. Reagents and conditions: NaOH ( 6.0 equiv.), $55^{\circ} \mathrm{C}, 12 \mathrm{~h} .{ }^{\text {a }}$ Not determined.

As expected, methoxide showed preference for the $S_{\mathrm{N}} 2$ pathway (entries a and d), with reasonable regioselectivity. Allyl alkoxide showed high regioselectivity when $\mathrm{R}=n$ $\mathrm{C}_{5} \mathrm{H}_{11}$ (entry $\mathbf{c}$ ). Methoxide reacted less selectively when $\mathrm{R}=\mathrm{Ph}$ (entry $\mathbf{d}$ ), possibly due to conjugation between the aryl and alkene $\pi$ systems. Unusually, hydroxide showed preference for the $\mathrm{S}_{\mathrm{N}} 2$ ' pathway (entry d).

### 1.15.2 Reactions with Nitrogen-based Nudeophiles

Reeve et al. reported the first use of a nitrogen nucleophile in the Jocic reaction (Scheme 69). ${ }^{338}$ The product amino acids 284 were obtained only after hydrolysis of the crude mixture. Intermediate $\alpha$-amino amides and peptides were postulated as intermediates, though these were not positively identified.

Scheme 69. Reagents and conditions: $\mathrm{KNH}_{2}$ (4.6 equiv.), $\mathrm{NH}_{3}(1),-33^{\circ} \mathrm{C}, 12 \mathrm{~h} . \mathrm{R}=\mathrm{Et}, i-\mathrm{Pr}, \mathrm{Ph}$.

When cyanamide $\left(\mathrm{NCNH}_{2}\right)$ was used as the nucleophile, an unexpected cyclisation reaction occurred to yield cyclic compounds 289 (Scheme 70). ${ }^{339}$ Initial ring opening of the gem-dichloroepoxide 286, followed by trapping of the resultant acyl chloride with an additional cyanamide anion, yielded the amino amide 288. Subsequent cyclisation and formation of a carboximidate (with alcohol from the solvent) led to the cyclic compounds 289 in yields of $22-61 \%$. A significant side reaction is the attack of an alkoxide ion on the dichloroepoxide 286, leading to the formation of an $\alpha$ alkoxyaryl acetic acid.

Scheme 70. Reagents and conditions: $\mathrm{NCNH}_{2}$ (2.4 equiv.), KOH ( 5.9 equiv.), ROH , rt, overnight. $\mathrm{R}=$ $\mathrm{CH}_{3}, \mathrm{C}_{2} \mathrm{H}_{5}, n$ - $\mathrm{Pr}, n-\mathrm{Bu} ; \mathrm{X}=\mathrm{H}, p-\mathrm{Cl}, p-\mathrm{OMe}$.

### 1.15.3 Reactions with Sulfur-based Nudeophiles

Reeve studied thiourea as an example of the Jocic reaction with a sulfur nucleophile (Scheme 71). ${ }^{340}$ Although thiourea is potentially an ambidentate ligand, no evidence was observed for attack by nitrogen on the gem-dichloroepoxide. Additionally, no $\alpha$ -
methoxyaryl acetic acids were observed, indicating that the sulfur nucleophile outcompetes any methoxide from the solvent.

Scheme 71. Jocic reaction of thiourea with aryltrichlorocarbinols. $\mathrm{R}=\mathrm{H}, 3,4$-dichloro, $p$-OMe.

The use of thiosemicarbazones or thioamide gave the heterocyclic compounds 293296 and 297 (Scheme 72) respectively, by an analogous mechanism. ${ }^{341}$ Further bifunctional reagents containing a nucleophilic sulfur atom were studied by Reeve and Coley III. ${ }^{342}$ Blanchett and Zhu later improved the yield of the reaction with substituted thioureas by using $\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}$ as the solvent. ${ }^{343}$

Scheme 72. Additional reactions with sulfur nucleophiles.

### 1.15.4 Reactions with Halide Nudeophiles

The first example of a reaction of this type was in the original publication from Jocic (Scheme 73), where he postulated chloride to be the nucleophile in the ring opening of epoxide 298. ${ }^{221,} 222$ Reeve has suggested that this reaction may go via different intermediates from the generally accepted gem-dichloroepoxide. ${ }^{344,345}$ However, this is not consistent with the stereospecificity of the reaction (see later) or with X-ray crystallography data. ${ }^{327}$ At temperatures above $0{ }^{\circ} \mathrm{C}$ considerable hydrolysis of the $\alpha$ -
chlorocarboxylic acid $\mathbf{3 0 0}$ occurs, to yield the $\alpha$-hydroxy-substituted acid. When tertiary trichlorocarbinols are used, the elimination of $\mathrm{CHCl}_{3}$ from the trichlorocarbinol $\mathbf{1 8 2}$ becomes a significant reaction pathway.

Scheme 73. The original Jocic reaction.

Oliver et al. prepared $\alpha$-fluoro carboxylic acids by treatment of trichlorocarbinols with tetrabutylammonium fluoride (TBAF) and cesium fluoride (Table 29). ${ }^{346}$ Good yields were obtained, although only four substrates were examined and all four were structurally very similar. The reaction failed when methanol was used as the solvent due to the formation of the $\alpha$-methoxy acid. Oliver et al. later used enantiomerically enriched trichlorocarbinols to obtain $\alpha$-fluoro carboxylic acids in $>92 \%$ e.e. but with $\alpha$-chloro carboxylic acid side products. ${ }^{347}$

| entry | R | $\mathbf{3 0 2}$ yield (\%) |  | entry | R |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{3 0 2}$ yield (\%) |  |  |  |  |  |

Table 29. Reagents and conditions: TBAF ( 12 equiv.), $\operatorname{CsF}$ ( 14 equiv.), $\mathrm{NEt}_{3}$ ( 7.2 equiv.), THF, reflux, 2 h .

### 1.15.5 Reactions with Hydride Nucelophiles

Snowden et al. developed several one-carbon homologation reactions, starting from trichlorocarbinols 304, employing hydride or selenide as the nucleophile (Scheme 74). ${ }^{348-350}$ Subtle differences in the reaction conditions provided either the homologated carboxylic acid $\mathbf{3 0 5}$, or the alcohol $\mathbf{3 0 6}$. The acid product is a result of hydrolysis of the intermediate acid chloride, whilst the alcohol results from faster reduction of the acid chloride by $\mathrm{LiBH}_{4}$. A proposed mechanism for the selenium reaction is shown in scheme 75 . When amines are added to the reaction mixture they trap the intermediate acid chloride (310) to yield amides 308.

Scheme 74. Various homologation procedures developed by Snowden et al. $\mathrm{R}^{1}=$ alkyl, alkenyl, aryl;

### 1.16Jodic Reactions with Enantiomerically Enriched

## Trichlorocarbinols

### 1.16.1 Readions with Oxygen-Based Nudeophiles

The highly stereospecific nature of the Jocic reaction has made it an attractive synthetic tool, if the starting trichlorocarbinols are obtainable in high stereochemical purity and racemisation is minimised. Wynberg et al. synthesised ( $R$ )- and ( $S$ )citramalic acid via the ring opening and intramolecular Jocic reaction of lactone $(R)$ 171 (Scheme 76). ${ }^{351}$ (S)-Citramalic acid was obtained without racemisation and in $96 \%$ yield. The $(R)$-enantiomer was obtained using the same procedure but starting from (S)-lactone.

Scheme 76. Stereospecific synthesis of ( $S$ )-citramalic acid.

Corey and Link employed a $p$-methoxyphenol nucleophile in the Jocic reaction with enantiomerically enriched trichlorocarbinols $\mathbf{3 1 2}$ (Scheme 77). ${ }^{352}$ The trichlorocarbinols were synthesised in $92-98 \%$ e.e. by the previously reported CBS reduction. ${ }^{298,301}$ Only for $\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{5}\left(\mathrm{CH}_{2}\right)_{2}$ was experimental data provided, with the authors claiming "optical purity" for the $\alpha$-hydroxy methyl ester 314 without providing additional evidence.

Scheme 77. Stereoselective synthesis of $\alpha$-hydroxy esters. $\mathrm{R}=n$-pentyl, $\mathrm{C}_{6} \mathrm{H}_{5}\left(\mathrm{CH}_{2}\right)_{2}$, cyclohexyl, $t$ butyl.

It has been shown previously that an appropriately placed hydroxyl group will act as a nucleophile in an intramolecular Jocic reaction. ${ }^{336}$ Oliver and Schmidt used this strategy in the synthesis of an enantiomerically enriched epoxyacid (318, Scheme 78). ${ }^{353}$

Scheme 78. Synthesis of an epoxycarboxylic acid via an intramolecular Jocic reaction. TBAOH $=$ tetrabutylammonium hydroxide.

Alcohol 316 was obtained as a 63:27 ratio of diastereoisomers, of which the $(2 R, 3 R)$ isomer was obtained directly by recrystallisation. The Jocic reaction of diol $\mathbf{3 1 7}$ to epoxide 318 proceeded stereospecifically with inversion, and none of the $(2 R, 3 R)$ diastereoisomer was detected. The biphasic conditions employed in this step helped to prevent racemisation of the $\mathrm{C}-2$ centre.

### 1.16.2 Reactions with Nitrogen-Based Nudeophiles

Corey and Link reported the convenient, enantioselective synthesis of $\alpha$-amino acids (Table 30). ${ }^{302}$ The amino acids $\mathbf{3 2 1}$ were obtained in high enantiomeric excess after reduction. The success of the reaction (and absence of racemisation) under these homogeneous conditions probably lies in the strong nucleophicity of azide.

|  |  | $\xrightarrow[\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}]{\mathrm{NaOH}, \mathrm{NaN}_{3}}$ | 320 yield (\%) |  |  <br> 321 yield (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |

| a | $n$-P | entyl | 89 |  | 94 |
| b | $\mathrm{C}_{6} \mathrm{H}_{5}$ | $\left(\mathrm{CH}_{2}\right)_{2}$ | 91 |  | 92 |
| c | $p-\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{C}$ | $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}$ | 82 |  | 98 |
| d | 2-Naphth | hylmethyl | 84 |  | 88 |
| e | Cyclo | ohexyl | 89 |  | 92 |
| f |  | utyl | 80 |  | 94 |

Table 30. Reagents and conditions: NaOH (4.0 equiv.), $\mathrm{NaN}_{3}$ (2.0 equiv.), $\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 12 \mathrm{~h} ; 10 \%$ Pd/C (25 wt\%), H2, EtOAc, rt, 12 h.

Romo et al. used Corey's conditions as part of the synthesis of an $\alpha$-azido $\gamma$-lactone (Scheme 79). ${ }^{354-356}$ Ring opening of the enantiomerically pure lactone 254a by the procedure of Fujisawa yielded diol 322 with no loss of stereochemistry. ${ }^{357,} 358$ Treatment with $\mathrm{NaOH} / \mathrm{NaN}_{3}$ then gave the lactone 323, after gentle heating in methanol to promote cyclisation.

Scheme 79. Stereospecific synthesis of an $\alpha$-azido $\gamma$-lactone. Reagents and conditions: DIBAL (1.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, $10 \mathrm{~h} ; \mathrm{NaOH}$ (4.0 equiv.), $\mathrm{NaN}_{3}$ (2.0 equiv.), $\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 12 \mathrm{~h}$.

As part of a synthesis towards Schulzeines B and C, Romo and Liu attempted to use similar methodology to generate intermediate 327 (Scheme 80). ${ }^{359}$ Unexpectedly, ring-opening of dichloroepoxide $\mathbf{3 2 5}$ by azide (path a) was not observed. Instead, intramolecular attack by the piperidine nitrogen atom (path b) occurred and
pyrrolidine $\mathbf{3 2 8}$ was formed as a 6:1 mixture of diastereoisomers. Boc protection of the piperidine N atom prior to the Jocic reaction yielded the desired azido compound 327.

Scheme 80. Attempted synthesis of $\delta$-lactam 327.

Shibasaki et al. described the diastereoselective synthesis of substituted azetidine-2carboxylic acids (Scheme 81). ${ }^{360}$ The trichlorocarbinol $\mathbf{3 2 9}$ was obtained in high d.e. by reduction of the trichloroketone precursor. No epimerisation of the C-2 chiral centre during the Jocic reaction was observed.

Scheme 81. Synthesis of a 3,4-syn-disubstituted azetidine-2-carboxylic acid.

Perryman et al. have used both symmetrical and unsymmetrical diamines in Jocic-type reactions with enantiomerically enriched trichlorocarbinols 332 (Scheme 82). ${ }^{361,} 362$ Generally, as the size of $\mathrm{R}^{2}$ on the secondary amine increases, the formation of 1substituted piperazin-2-ones (333) was favoured. This may be due to preferential attack of the less sterically hindered amine when opening the dichloroepoxide. For all the substrates examined high e.e. values were obtained; however, under homogenous reaction conditions (aq. $\mathrm{NaOH}, \mathrm{MeOH}$ ) the e.e. of the products was lowered. Racemic reactions of this type had been previously reported by Lai, although with lower regioselectivity. ${ }^{363,364}$

Scheme 82. Synthesis of piperazin-2-ones. $\mathrm{R}^{1}=\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Ph}, \mathrm{R}^{2}=$ alkyl, aryl.

Dominguez et al. reported so-called "modified Corey-Link" conditions in the synthesis of (+)-LY354740, a potent agonist for the group 2 metabotropic gluatamate receptors (mGluRs) ${ }^{365}$ (Scheme 83). ${ }^{366,367}$ (+)-LY354740 showed efficacy in clinical studies for the treatment of generalised anxiety disorder (GAD). ${ }^{368}$ Alcohol 336 was obtained in enantiomerically pure form due to attack of the trichloromethyl anion on the less sterically hindered face. When Corey's conditions were applied the desired $\alpha$ azido acid 337 was contaminated with the diacid, which made purification difficult. In order to avoid this partial ester hydrolysis, anhydrous conditions using the organic base DBU were employed. Under these milder conditions the reaction proceeded smoothly with complete inversion. Notably, the Strecker reaction gave rise to the opposite stereochemistry at this quaternary centre. ${ }^{369}$ This "modified Corey-Link"
methodology has found considerable application, particularly in sugar chemistry. ${ }^{370-}$ 372

Scheme 83. Synthesis of (+)-LY354740.

Aitken et al. applied similar modified conditions in the synthesis of $\alpha$-aryl glycines (Scheme 84). ${ }^{373}$ The use of Corey and Link's original procedure resulted in complete racemisation of $\mathbf{3 3 9}$. However, by using DBU as the base, the ( $S$ )-aryl glycines 340 were prepared in overall yields of $40-62 \%$ and $>97 \%$ e.e. in all examples.

Scheme 84. Reagents and conditions: DBU (1.0 equiv.), $\mathrm{NaN}_{3}$ ( 2.0 equiv.), $\mathrm{DME} / \mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 24 \mathrm{~h}$.

Schafmeister et al. employed both modified and original Corey-Link conditions during the separate syntheses of $\mathbf{3 4 2}$ and $\mathbf{3 4 4}$, precusors to bis-amino acid monomers (Scheme 85). ${ }^{374,375}$

Scheme 85. Synthesis of two bis-amino acid monomer precursors.

Lee et al. synthesised $\alpha$-azido acid 347 using modified Corey-Link conditions (Scheme 86), ${ }^{376}$ as part of efforts to identify a novel series of $\beta$-site amyloid precursor protein cleaving enzyme (BACE-1) inhibitors. ${ }^{377,378}$ During scale-up studies it was found that a Jocic reaction with 3-fluoroaniline provided a better alternative to using azides (Scheme 87). ${ }^{379,380}$

Scheme 86. Discovery synthesis of lead compound 348.

Scheme 87. Optimised synthesis for large-scale production.

### 1.16.3 Readions with Other Nudeophiles

Stick et al. used a number of nucleophiles in the Jocic reaction with a sugar-derived trichlorocarbinol (Scheme 88). 327, 381

Scheme 88. Conditions: a) DBU, MeOH, 83\%; b) CsF, DBU, MeOH, 85\%; c) NaOMe, MeOH, 54\%;
d) $\mathrm{NaCN}, \mathrm{DBU}, \mathrm{MeOH}, 80 \%$; e) KOCN, $\mathrm{DBU}, \mathrm{MeOH}, 50 \%$.

### 1.17 Bargellini Readtions

Like the Jocic reaction, what has become known as the Bargellini reaction was discovered in the early 1900s and involves a gem-dichloroepoxide as a key intermediate. The difference between the two lies in the isolation of a trichlorocarbinol; in the Jocic reaction these are typically synthesised or purchased initially and then reacted further with nucleophiles, whilst in a Bargellini reaction they are generated in situ (Scheme 43). The one-pot, operationally simple nature of these reactions have made them attractive to researchers in the pharmaceutical industry. Examples of such target molecules are shown in figure 5. ${ }^{382-389}$

Allosteric modifier of human hemoglobin

$\beta_{3}$-adrenoreceptor ligands

Sodelglitazar - PPAR Panagonist

Figure 5. A selection of target compounds which use a Bargellini reaction to install the $\alpha$ disubstituted carboxylic acid motif.

Lai reported an interesting variation on the usual Bargellini reaction, using a hindered phenol as the nucleophile (Scheme 89). ${ }^{390}$ Due to the hindered nature of the phenol, the dichloroepoxide intermediate is attacked by the para carbon of the phenol. The acid chloride was trapped by a range of secondary amines to yield amides $\mathbf{3 5 4}$.

Scheme 89. Reagents and conditions: ketone ( 8.0 equiv.), $\mathrm{CHCl}_{3}$ ( 1.3 equiv.), NaOH (4.5 equiv.), $10^{\circ} \mathrm{C}, 20 \mathrm{~h} . \mathrm{R}^{1} / \mathrm{R}^{2}=$ alkyl, cycloalkyl; $\mathrm{R}^{3}=$ alkyl.

Classically, a phenol is used as the nucleophile in the Bargellini reaction. Butcher and Hurst demonstrated that anilines work well in place of phenol (Table 31). Better yields were obtained with the more electron-rich anilines (entries a and $\mathbf{e}$ ), which mirrors the reactivity of phenols as expected. In addition to the nucleophiles shown in table 31, Butcher and Hurst also used thiophenol (71\% yield), 2-aminopyridine (72\% yield) and $1 H$-pyrazole ( $56 \%$ yield). KF on alumina was reported as an alternative base by Myrboh and Rohman. ${ }^{391}$ Saidi and Aryanasab employed a wider range of thiol nucleophiles, including the first reported use of dithiocarbamic acid as a nucleophile. ${ }^{392}$

## Chapter 2: The Total Synthesis of Vitamin E

The preliminary disconnections for the synthesis proposal are shown in scheme 90. The disconnection of vitamin E to the chromane aldehyde 35 and $(R, R)$ hexahydrofarnesol $\mathbf{3 2}$ is well documented in the literature. ${ }^{166}, 167,169-173,196,393,394 \mathrm{We}$ imagined that we could ultimately synthesise the key aldehyde via the intramolecular Jocic reaction of phenol 170. Using this strategy, all four tocopherol analogues should be accessible.

32

### 2.1 Synthesis of Model Compounds

We initially anticipated that the $\beta$-keto trichlorocarbinol $\mathbf{1 7 0}$ should be accessible from the ring-opening of Wynberg lactone $(R)$-171. The Friedel-Crafts ring opening of a related lactone $(R)$ - $\mathbf{2 5 4 a}$ was reported to take place with no change in the enantiomer composition (Scheme 91). ${ }^{395}$

Scheme 91. Friedel-Crafts acylation of anisole with trichlorolactone ( $R$ )-254a.

The ring opening of lactone $\mathbf{1 7 1}$ by this method has not been reported in the literature. In contrast to the 4-monosubstituted derivative 254a, reports on the use of lactone $\mathbf{1 7 1}$ in synthesis are scarce. Of only two reports in the literature, both involve the basic hydrolysis of $(R)$ - or $(S)$-171 to yield $(R)$ - or (S)-citramalic acid respectively (Scheme 92). ${ }^{351}$

Scheme 92. Synthesis of (S)-citramalic acid by Wynberg and Staring.

Gill et al. used lactone $\mathbf{1 7 1}$ as a source of citramalic acid for their synthesis of ( $1 S, 3 S$ )Austrocortilutein (Scheme 93). ${ }^{396}$ Using ( $S$ )-171 allowed the synthesis of the other $(1 R, 2 R)$ enantiomer.

363
(1S,3S)-austrocortilutein

Scheme 93. Synthesis of ( $1 S, 3 S$ )-austrocortilutein.

We anticipated that lactone 171 could be ring opened by a suitable 1,4dimethoxybenzene compound, to ultimately yield phenol $\mathbf{1 7 0}$ (Scheme 94).

$\mathrm{P}=$ suitable protecting group

Scheme 94. Proposed Friedel-Crafts acylation of protected hydroquinones.

Protecting groups were needed both to prevent $O$-acylation and to stabilise the hydroquinone against oxidation during the reaction. Methyl ethers were expected to survive the strongly acidic conditions, although they can require strong reagents for deprotection. Accordingly, 2,3,5-trimethyldimethoxy benzene $\mathbf{3 6 4}$ and 2,3dimethyldimethoxy benzene $\mathbf{3 6 5}$ were synthesised using a literature procedure ${ }^{397}$ (Scheme 95) and subjected to the Friedel-Crafts conditions reported by Fujisawa et al. (Scheme 96). ${ }^{395}$

Scheme 95. Methylation of hydroquinones.

Scheme 96. Attempted ring opening of lactone 171 under Friedel-Crafts conditions.

Unfortunately, neither trichlorocarbinol 366 nor 367 were observed under these conditions even at increased reaction temperatures and times. Seeking an alternative procedure, we attempted to synthesise lithiated derivatives of $\mathbf{3 6 4}$ and $\mathbf{3 6 5}$ in situ, and treat these with lactone 171 (Scheme 97).

Scheme 97. Attempted ring opening of lactone 171 by lithiation of arenes $\mathbf{3 6 4}$ and 365 . TMEDA = tetramethyl ethylenediamine.

This reaction yielded unchanged starting materials, although quenching the reaction with $\mathrm{D}_{2} \mathrm{O}$ showed complete deuterium incorporation, suggesting that it was the ringopening step which was failing. The use of brominated arenes $\mathbf{3 7 0}$ or $\mathbf{3 7 1}$ in a lithium exchange reaction also failed (Scheme 98).

Scheme 98. Attempted ring opening of lactone $\mathbf{1 7 1}$ by the lithium exchange of bromobenzenes. NBS $=N$-bromosuccinimide.

Since the reactions were probably failing on steric grounds, commercially available 1,4-dimethoxybenzene $\mathbf{3 7 2}$ was used as a less challenging model substrate. Thus, treatment of $\mathbf{3 7 2}$ with $\mathrm{AlCl}_{3}$ and $\mathbf{1 7 1}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ provided the trichlorocarbinol $\mathbf{3 7 3}$ in good yield and with $\geq 98 \%$ e.e. (Scheme 99). The enantiomeric excess of trichlorocarbinol 373 was measured by comparison with a racemic substrate (see later).

Scheme 99. Successful ring opening of lactone 171.

Our proposal for an intramolecular Jocic reaction required that the 2 '-methoxy group be deprotected, and a report in the literature from Du et al. suggested that this could be carried out selectively due to the ortho-acyl substitution. ${ }^{398}$ However, given that Du et al. used $\mathrm{AlCl}_{3}$ to accomplish this transformation, and that no demethylated products were observed in the reaction of $\mathbf{3 7 2}$ to $\mathbf{3 7 3}$, it seemed unlikely that this reaction would
be successful. Nevertheless, it was attempted (1.5 equiv. $\mathrm{AlCl}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt) and found that the starting materials remained unchanged. Using toluene as the solvent to increase the reaction temperature resulted in decomposition of the substrate at temperatures above $60^{\circ} \mathrm{C}$ (Scheme 100).

Scheme 100. Failed ortho-selective demethylation reaction.

Using NaI or LiI in DMF under microwave irradiation ${ }^{399}$ also failed to yield any phenol products (Scheme 101).

Scheme 101. Unsuccessful demethylation using NaI or LiI.

More promisingly, a TMS-Cl/NaI system developed by Olah et al. ${ }^{400}$ yielded a mixture of both partially and completely demethylated compounds (Scheme 102). The ratio of [374:375:376] was approximately 1:0.6:0.6 as determined from the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture. Even though this reaction displayed poor selectivity for the ortho methoxy group, we decided to optimise the reaction conditions for the synthesis of the hydroquinone $\mathbf{3 7 6}$ since separation of all three compounds by column chromatography was difficult.

Scheme 102. Unoptimised demethylation of methyl ether 373.

Unfortunately, the highest yield obtained for this reaction was $33 \%$ (Scheme 103). This may be partly because hydroquinone $\mathbf{3 7 6}$ is readily oxidised - the compound was also unstable towards column chromatography.

Scheme 103. Optimised demethylation protocol.

Despite the low yields obtained from the demethylation step, sufficient material could be brought through to test the key step; the intramolecular Jocic reaction. Thus, treatment of hydroquinone $\mathbf{3 7 6}$ with four equivalents of 2 M NaOH (aq.) yielded the 4-oxochromane-2-carboxylic acid 379 (Scheme 104). The reaction was carried out under nitrogen and in a sparged solution to minimise oxidation of the hydroquinone. Initially, the work up consisted of pH adjustment to 2-3 followed by extraction with EtOAc. Cleaner product could be obtained by first washing the alkaline solution with organic solvent to remove organic soluble byproducts, before lowering the pH to release the compound.

Scheme 104. Intramolecular Jocic reaction mechanism.

The accepted mechanism for the conversion of $\mathbf{3 7 6}$ into $\mathbf{3 7 9}$ is shown in scheme 104. Contrary to Reeve's claim that tertiary trichlorocarbinols cannot take part in the Jocic reaction, ${ }^{345}$ reasonable yields of the $\alpha$-disubstituted carboxylic acid 379 could be obtained. No evidence of ring opening of the intermediate epoxide 377 by either chloride or another molecule of $\mathbf{3 7 6}$ was observed.

We first attempted to measure the enantiomeric excess of the C-2 centre by coupling carboxylic acid 379 to ( $S$ )- and ( $R$ )- $\alpha$-methylbenzylamine (Scheme 105). Unfortunately, the $\mathrm{CH}_{3} \mathrm{CH}$ doublets in $(S, S)$ - and $(S, R)$ - $\mathbf{3 8 0}$ were not different enough in chemical shift to be useful as a measure of the diastereomeric ratio. The $\mathrm{CH}_{3}$ singlet also did not show enough of a difference in chemical shift in either diastereoisomer.

Scheme 105. Synthesis of diastereomeric amides 380.

A racemic synthesis of $\mathbf{3 7 9}$ was planned (Scheme 106), which would also allow for an e.e. measurement of compound 373 .

Scheme 106. Synthesis of 4-oxo-chromane ( $\pm$ )-382.

The aldol condensation of acetophenone 381 with 1,1,1-trichloroacetone proceeded with moderate yields, and no elimination product was observed. An attempted acid catalysed aldol reaction failed (Scheme 107).

Scheme 107. Failed acid-catalysed aldol condensation.

The demethylation of trichlorocarbinol ( $\pm$ )-373 proceeded with slightly greater yield than for the enantiomerically enriched compound, and subsequent treatment with 2 M NaOH (aq.) in acetone yielded the carboxylic acid ( $\mathbf{\pm}$ )-379. Chiral HPLC analysis was performed on the ester ( $\pm$ )-382.

Chiral HPLC analysis showed no loss of stereochemistry during the ring-opening reaction of lactone 171, as hoped (Figure 6). The intramolecular Jocic reaction also proceeded without racemisation (Figure 7). This complete lack of racemisation is a consequence of the intramolecular ring opening of the intermediate dichloroepoxide 377 taking place in strict $\mathrm{S}_{\mathrm{N}} 2$ fashion. Additionally, neither acid chloride $\mathbf{3 7 8}$ nor the acetate product $\mathbf{3 7 9}$ are enolisable.

Figure 7. Top: HPLC trace of ( $\pm$ )-382. Bottom: HPLC trace of ( $S$ )-382. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=90: 10,1 \mathrm{~mL} / \mathrm{min}, 220 \mathrm{~nm},(R)$ isomer $14.35 \mathrm{~min},(S)$ isomer 16.12 min .

### 2.2 Synthesis of Aldehyde 35

Having proved that we could synthesise chromane compounds in high enantiomeric excess using our Jocic reaction strategy, we turned our attention back to the synthesis of aldehyde 35. Inspired by a report in the literature, ${ }^{216}$ we hoped that the Fries rearrangement of 385 would give phenol 386 (Scheme 108). Unfortunately, the reaction of ester $\mathbf{3 8 5}$ failed to give any trace of phenol $\mathbf{3 8 6}$ even after heating at reflux temperature for three days. Thankfully, we found that using $\mathrm{TiCl}_{4}$ in place of $\mathrm{AlCl}_{3}$ in the ring-opening of lactone $\mathbf{1 7 1}$ gave the acylated compound $\mathbf{3 6 6}$ in good yield after optimisation of the reaction conditions (Scheme 109).

Scheme 108. Attempted synthesis of monoprotected phenol 386.

Scheme 109. Successful ring opening reaction of lactone 171.

The reaction failed or was very low yielding when fewer than 10 equivalents of the arene 364 were used, although a large proportion ( $\sim 80 \%$ ) could be recovered and reused. It was notable that the reaction was also low yielding when $\mathrm{TiCl}_{4}$ was used as
a 1 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, or when the neat $\mathrm{TiCl}_{4}$ was more than a month old. Despite the large excess of $\mathbf{3 6 4}$, the reaction is easily monitored using ${ }^{1} \mathrm{H}$ NMR spectroscopy by the change in chemical shift of the alkyl methyl group (highlighted, Figure 8). Compound 366 was then subjected to the same sequence of reactions previously developed, to yield 4-oxochromane ester $\mathbf{3 8 7}$ (Scheme 110). The racemate of ester $\mathbf{3 8 7}$ was prepared in the same way for HPLC analysis (Scheme 111). Figures 9 and 10 show that a high enantiomeric excess was maintained throughout the synthesis.

Figure 8. Top ${ }^{1} \mathrm{H}$ NMR spectrum: $(R)$-lactone 171. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: compound 366.

Scheme 110. Synthesis of ester 387.

Scheme 111. Synthesis of racemate ( $\pm$ )-387.

Figure 9. Top: HPLC trace of ( $\pm$ )-366. Bottom: HPLC trace of ( $R$ )-366 Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=95: 5,1 \mathrm{~mL} / \mathrm{min}, 214 \mathrm{~nm},(R)$ isomer $7.67 \mathrm{~min},(S)$ isomer 8.65 min.

Figure 10. Top: HPLC trace of $( \pm)-\mathbf{3 8 7}$. Bottom: HPLC trace of $(S)$-387. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=95: 5,1 \mathrm{~mL} / \mathrm{min}, 221 \mathrm{~nm},(S)$ isomer $29.05 \mathrm{~min},(R)$ isomer 31.92 min.

Despite the low yielding demethylation of the trichlorocarbinol 366, multigram quantities of ester $\mathbf{3 8 7}$ could still be obtained through this route so we decided to continue the synthesis of aldehyde 35. The synthesis of primary alcohol $\mathbf{3 9 0}$ had been reported from ester 388, ${ }^{140}$ and the oxidation of alcohol $\mathbf{3 9 0}$ was a known reaction ${ }^{201}$, ${ }^{394,401}$ (Schemes 112 and 113).

Scheme 112. Planned synthesis of aldehyde 35.

Therefore, all we had to do to get to known chemistry from our intermediate $\mathbf{3 8 7}$ was reduce the carbonyl group; this was achieved in $51 \%$ yield by using a Clemmensen reduction. ${ }^{402}$ The remainder of the synthesis proceeded smoothly. The oxidising reagent 2-iodoxybenzoic acid (IBX) ${ }^{403}$ was chosen over other common oxidation protocols (Swern, Parikh-Doering) as it was higher yielding. Additionally, the crude product was clean enough to be used in the next step without further purification.

Scheme 113. Synthesis of aldehyde 35.

### 2.3 Completion of the $\alpha$-Tocopherol Synthesis

With aldehyde 35 in hand, the final steps in the synthesis consisted of the Wittig coupling of aldehyde 35 with the phosphonium salt 392, followed by concurrent hydrogenation of the double bond and removal of the benzyl protecting group (Scheme 114). $(R, R)$-Hexahydrofarnesol 32 was provided by DSM Nutritional Products and it can be synthesised by the asymmetric hydrogenation of farnesol (Scheme 115).

Scheme 114. Completion of the synthesis of $\alpha$-tocopherol 1.

Scheme 115. Synthesis of $(R, R)$-hexahydrofarnesol. The supplied hexahydrofarnesol 32 was of the following stereochemical composition: $(3 R, 7 R) 93 \%,(3 S, 7 S) 0 \%,(3 R, 7 S) 5.8 \%,(3 S, 7 R) 0.75 \%$. This corresponds to an e.e. $(\mathrm{C}-3)=99 \%$ and e.e. $(\mathrm{C}-7)=88 \%$.

Both the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of our synthesised $\alpha$-tocopherol 1 showed good correlation with an authentic sample (Figures 11 and 12). The phenol was protected as its acetate $\mathbf{3 9 4}$ to prevent ready oxidation of the compound.

Figure 11. Top ${ }^{1} \mathrm{H}$ NMR spectrum: synthesised $\alpha$-tocopherol 1. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: authentic sample purchased from TCI (UK).

Figure 12. Top ${ }^{13} \mathrm{C}$ spectrum: Synthesised $\alpha$-tocopherol 1. Bottom ${ }^{13} \mathrm{C}$ spectrum: authentic sample purchased from TCI (UK).

### 2.4 Trolox

Trolox, 395, is a water-soluble vitamin E analogue which is known to prevent cell death by apoptosis. ${ }^{404-407}$ This compound is commonly synthesised in racemic form via hydrolysis of the ester $( \pm) \mathbf{- 3 8 8}$, which in turn can be synthesised using a hetero-Diels-Alder reaction (Scheme 116). ${ }^{408,409}$ This carboxylic acid ( $\pm$ )-395 can then be resolved using an amine base such as $(1 R, 2 S)$-cis-2(benzylamino)cyclohexylmethanol 396.

We synthesised ( $S$ )-Trolox $\mathbf{3 9 5}$ by the hydrolysis of the previously synthesised ester (S)-388 (Scheme 117).

Scheme 116. Industrial synthesis of ( $S$ )-Trolox 395.

Scheme 117. Synthesis of (S)-Trolox 395 by the hydrolysis of methyl ester ( $S$ )-388.

### 2.5 Revised Preparation of Methyl Ester 387

Having completed the synthesis of $\alpha$-tocopherol $\mathbf{1}$, we felt that the demethylation step in particular left a lot to be desired in terms of yield and ease of purification. Alternative protecting groups which would potentially be easier to remove (benzyl, benzoyl and acetyl) failed to survive the strongly acidic conditions of the FriedelCrafts ring opening (Scheme 118).

Scheme 118. Attempted use of alternative phenol protecting groups.

Any methyl ether deprotection methods that required alkaline conditions, for example sodium thioethoxide in DMF, ${ }^{410-412}$ were not considered due to the base-sensitive nature of the trichlorocarbinol group. In addition, due to the observed instability of the hydroquinone 170, we sought a procedure where we could carry out the key Jocic reaction without isolation of this unstable intermediate.

In our original synthesis proposal we focused on milder demethylation methods because we were concerned about the stability of the trichlorocarbinol moiety; however, since the group survived the reaction with $\mathrm{TiCl}_{4}$, it was shown to be more stable to Lewis acids than we imagined. $\mathrm{BBr}_{3}$ is an extremely Lewis acidic reagent commonly used to remove methyl ethers, ${ }^{413,414}$ but one which was initially rejected by us due to its highly reactive nature. However, in light of the results obtained, we decided to test this reagent in the demethylation reaction of $\mathbf{3 6 6}$ (Scheme 119).

Scheme 119. Demethylation of aryl methyl ethers using $\mathrm{BBr}_{3}$.

Pleasingly, treatment of $\mathbf{3 6 6}$ with $\mathrm{BBr}_{3}$ gave complete conversion into $\mathbf{1 7 0}$. In order to minimise exposure of hydroquinone $\mathbf{1 7 0}$ to air, the reaction was quenched under nitrogen and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent was removed under a flow of nitrogen. Redissolving this crude mixture in THF and adjusting the pH to 13-14 triggered the desired Jocic reaction. The carboxylic acid $\mathbf{1 6 9}$ was then directly esterified as a crude mixture to yield the methyl ester 387, in a yield of $34 \%$ from $\mathbf{3 6 6}$. This improved procedure provided the ester 387 in an approximately two-fold better yield than the previous synthesis, with the total reaction time reduced from five days to three days.

### 2.6 Synthesis of $\gamma$-Tocopherol

### 2.6.1 Previous Literature Syntheses

There are considerably fewer reports on the synthesis of $\gamma$-tocopherol compared to $\alpha$ tocopherol, probably due to the higher biological activity of the $\alpha$-form. The first asymmetric synthesis of $\gamma$-tocopherol was reported by Minnaard et al. (Scheme 120). ${ }^{415}$

Ligand $=$

Scheme 120. Total synthesis of $\gamma$-tocopherol.

The key step was the asymmetric 1,2-addition of the Grignard reagent 401 to acetophenone 400, using a chiral ferrocenyl ligand. ${ }^{416,417}$ Of the nine different ligands screened, the highest d.e. attained for the 1,2-addition was 73\%. The Grignard reagent 401 was derived from natural phytol. Attempted hydrogenation of the allylic alcohol 402 using conventional metal catalysts $\left(\mathrm{Pd} / \mathrm{C}, \mathrm{Pt} / \mathrm{C}, \mathrm{PtO}_{2}\right)$ resulted in hydrogenolysis of the alcohol, hence the use of flavin catalysis. ${ }^{418,419}$ The remainder of the synthesis from compound $\mathbf{4 0 3}$ was carried out according to the synthesis of $\alpha$-tocopherol by Cohen et al. ${ }^{171}$

In a synthesis by Reuping et al., a gold-catalysed allylic substitution was used to produce vinyl chromane 405 with $86 \%$ e.e. (Scheme 121). ${ }^{420}$ A cross-metathesis reaction with alkene 406, obtained from the asymmetric hydrogenation of phytol by the method of Pfaltz, ${ }^{164}$ yielded $\gamma$-tocopherol $\mathbf{3}$ after hydrogenation.

Scheme 121. Synthesis of $\gamma$-tocopherol by Reuping et al.
$\gamma$-Tocopherol is arguably most easily synthesised from commercially available $\alpha$ tocopherol. Salvadori et al. synthesised $\gamma$-tocopherol by the aryl demethylation of $\alpha$ tocopherol (Scheme 122). ${ }^{421}$ This builds on previous work reported by Rosenau and Habicher, ${ }^{422}$ who accomplished the decarboxylation of carboxylic acid 409 by photoirradiation.

Scheme 122. Synthesis of $\gamma$-tocopherol by the demethylation of $\alpha$-tocopherol.

### 2.6.2 Our Total Synthesis

Examples in the literature seemed scarce, and previous attempts at the asymmetric synthesis of $\gamma$-tocopherol had resulted in unsatisfactory enantiomeric excess at the C 2 centre. Therefore, we decided to synthesise $\gamma$-tocopherol $\mathbf{3}$ using our protocol (Scheme 123).

The synthesis started from 2,3-dimethyl-1,4-dimethoxybenzene $\mathbf{3 6 5}$, which was synthesised using the same literature procedure as for $\mathbf{3 6 4}$ (see scheme 95). The rest of the synthesis proceeded using identical conditions to those used in the synthesis of $\alpha$-tocopherol, with the exception that our demethylation/Jocic reaction procedure was used to give the ester 411 in comparable yield.

Scheme 123. Synthesis of $\gamma$-tocopherol.

The enantiomeric excess of ester $\mathbf{4 1 1}$ was measured to be $\geq 98 \%$ by chiral HPLC (Figures 13 and 14). This synthesis represents an improvement on previous reports in the literature where enantiomeric purity at the $\mathrm{C}-2$ centre was unattainable. In addition, this work represents the first synthesis of $\gamma$-tocopherol by the popular Wittig coupling route on which the majority of asymmetric vitamin E syntheses are based.

Figure 13. Top: HPLC trace of $( \pm)$-367. Bottom: HPLC trace of $(R)$-367. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=4: 96,1 \mathrm{~mL} / \mathrm{min}, 227 \mathrm{~nm},(S)$ isomer $18.55 \mathrm{~min},(R)$ isomer 19.88 min

Figure 14. Top: HPLC trace of $( \pm)-411$. Bottom: HPLC trace of ( $S$ )-411. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=6: 94,1 \mathrm{~mL} / \mathrm{min}, 231 \mathrm{~nm},(S)$ isomer $19.64 \mathrm{~min},(R)$ isomer 22.59 min .

### 2.7 Other Tertiary Tridilorocarbinol Substrates

### 2.7.1 Reactions with Carbon Nudeophiles

Given the success of the previous work, we were interested in potentially expanding the methodology to include nitrogen and sulfur-based nucleophiles, as well as altering the position of the intramolecular nucleophile in order to generate either 5- or 6membered rings.

We anticipated that the lactone $\mathbf{1 7 1}$ would be susceptible to ring-opening by a variety of nucleophiles, and in addition it is a source of tertiary trichlorocarbinols which are hard to synthesise in high enantiomeric excess by other means. Using carbon-based nucleophiles as the starting point, it has been shown that using $N$-methoxy- $N$-methyl amide or morpholine amide derivatives prevents over-addition if lactones such as 254a are directly reacted with organometallic reagents (Scheme 124). ${ }^{355}$

Scheme 124. Preparation of $\beta$-hydroxy(trichloromethyl) ketones. $\mathrm{R}=$ alkyl, aryl, allyl, vinyl.

N -Methoxy- N -methyl amides (Weinreb amides) are well known to afford a variety of ketones cleanly and in good yield on reaction with organolithium and Grignard reagents (Scheme 125). ${ }^{423}$

$\mathrm{R}^{1}=$ aryl, alkyl, alkenyl, alkynyl
$R^{2}=$ aryl, alkyl, alkenyl, alkynyl

Scheme 125. Synthesis of ketones using Weinreb amides.

Little or no double addition is observed even with excess organometallic reagent. This is possibly due to metal chelation to the methoxy group which ensures that collapse of the tetrahedral intermediate $\mathbf{4 2 0}$ only occurs on work up, with simultaneous quenching of the excess organometallic species. Morpholine amides work by a similar mechanism (Scheme 126). ${ }^{424}$

Scheme 126. Acylation of organometallic compounds using morpholine amide.

Ring opening of lactone $\mathbf{1 7 1}$ with $\mathrm{N}, \mathrm{O}$-dimethylhydroxylamine $\mathbf{4 2 5}$ was expected to give the amide 426 (Scheme 127), which could then undergo coupling with organometallic reagents. Our initial plan was that the organometallic species would contain a protected nucleophilic group, which would be unmasked to take part in an intramolecular Jocic reaction. The desired ketone product could also potentially undergo a reductive amination, ${ }^{425,426}$ followed by an intramolecular Jocic reaction, to yield substituted azetidines (433) in diastereoselective fashion (Scheme 128).

Scheme 127. Synthesis of morpholine amide 428. DIPEA $=$ diisopropylethylamine, DMAP $=p$ dimethylaminopyridine.

Unfortunately, attempts to synthesise the Weinreb amide 426 failed, either by a reported direct ring opening of the lactone $\mathbf{1 7 1}$ or by coupling with carboxylic acid 427 using an acid activating reagent. However, the lactone underwent ring opening readily with morpholine to give the amide 428. Microwave conditions were chosen since the required reaction time was greatly reduced compared to conventional heating.

Scheme 128. Proposed synthesis of cyclic structures using an intramolecular Jocic reaction.

With the morpholine amide 428 in hand, we first sought to test the reaction using EtMgCl as a simple Grignard reagent. Unfortunately, the expected ketone was not observed under any of the conditions tested. Using two equivalents of EtMgCl in THF at room temperature overnight yielded largely unreacted starting material, with a small amount of an unknown side product (Scheme 129). This was eventually identified by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy as compound 434 (Figure 15) and two mechanisms for its formation are proposed (Schemes 130 and 131). In addition, the crude ${ }^{1} \mathrm{H}$ NMR spectrum showed the presence of unsaturated compounds, although these could not be identified.

Scheme 129. Unexpected formation of compound 434.

The alkyl migration proposed in scheme 130 bears similarity to other well-known rearrangements which involve migration to electron deficient nitrogen, in particular the Lossen, ${ }^{427}$ Curtius, ${ }^{428}$ Schmidt, ${ }^{429}$ Beckmann ${ }^{430}$ and Tiffenau-Demjanov ${ }^{431}$ rearrangements. Migrations of this type have not been reported for trichlorocarbinol compounds. The second mechanism (Scheme 131) requires the formation of a dichlorocyclopropane. ${ }^{432,433}$

Scheme 130. Mechanism for the formation of compound 434 involving an alkyl migration.

Scheme 131. Mechanism for the formation of compound 434 via a cyclopropane rearrangement.

The EtMgCl is acting as both a base and a nucleophile in both mechanisms. Compound 434 was isolated as a single diastereoisomer, with the other diastereoisomer being inseparable from the unreacted starting material. The crude mixture showed an approximate 2.5:1 ratio of these diastereoisomers, with the major isomer being the one isolated (Figure 15).

Figure 15. Top ${ }^{1} \mathrm{H}$ NMR spectrum: isolated single diastereoisomer of compound 434. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: crude reaction mixture. Inset: CHCl doublets.

In an attempt to increase the yield of $\mathbf{4 3 4}$ the reaction was carried out under elevated temperatures, from $40^{\circ} \mathrm{C}$ to reflux (Scheme 132). At reflux temperature, lactone $\mathbf{4 3 5}$ (Figure 16) was formed in addition to amide 434. Its formation can be rationalised by either of the mechanisms shown in schemes 133 and 134.

Scheme 132. Unexpected formation of lactone 435.

Figure 16. ${ }^{1} \mathrm{H}$ NMR spectrum of isolated lactone 435.

Scheme 133. Potential mechanism for the formation of lactone 435.

Scheme 134. Potential mechanism for the formation of lactone 435.

The two mechanisms proposed for the formation of lactone $\mathbf{4 3 5}$ involve either an alkyl migration or a cyclopropane rearrangement. The $\gamma$-keto amide 434 cannot be an intermediate in the reaction mechanism as this would yield the lactones 436 or 437 . (Scheme 135).

Scheme 135. Potential mechanisms for the formation of lactones which were not observed in the reaction mixture.

The reaction with PhMgCl yielded largely unreacted starting material with some unidentifiable side products (Scheme 136). None of the desired addition to the morpholine amide was observed.

Scheme 136. Unsuccessful reaction with phenylmagnesium chloride.

Grignard reagents had appeared to be unsuitable, so organolithium reagents were explored instead. The reaction with $n$-butyllithium appeared to give none of the desired addition product (Scheme 137).

Scheme 137. Reaction of morpholine amide 428 with $n$-BuLi.

At $0{ }^{\circ} \mathrm{C}$ the crude reaction mixture was largely unreacted starting material. However, when the reaction was stirred at $23{ }^{\circ} \mathrm{C}$ for 16 hours more of the starting material was consumed. Unfortunately, it was not converted into the ketone $\mathbf{4 3 8}$ but mainly into a compound $\mathbf{4 3 9}$ which we were unable to identify (Scheme 138 and Figure 17).

Scheme 138. Reaction of morpholine amide $\mathbf{4 2 8}$ at elevated reaction temperature and time.

This compound was not a result of addition of the organolithium to the amide, since the broad peak between $3.95-3.32 \mathrm{ppm}$ can be assigned to the protons on the morpholine ring. Peaks corresponding to vinyl protons were also present (5.13, 5.04
and 4.90 ppm ), as well as incorporation of two butyl groups (triplet at 0.91 integrates to six protons).

Figure 17. ${ }^{1} \mathrm{H}$ NMR of isolated side product 439.

Even with the use of HSQC and HMBC correlation experiments we were not able to positively identify this compound.

When KOt -Bu was used as a strong, non-nucleophilic base, the sole product obtained was 1-morpholinobutane-1,3-dione 440, by elimination of $\mathrm{CHCl}_{3}$ (Scheme 139). These results indicate that the EtMgCl potentially has some function as a Lewis acid assisting the chloride leaving in all of the mechanisms previously discussed.

Scheme 139. Elimination of $\mathrm{CHCl}_{3}$ from amide 428.

### 2.7.2 Reactions with Nitrogen Nudeophiles

Using organometallic reagents in the presence of the trichlorocarbinol functional group had proved troublesome. However, amides of the type 441 are readily synthesised in high yields. Ongoing work in the group had shown that amides such as 441 will ring close when treated with four equivalents of NaOH , to produce $\beta$-lactams with complete stereocontrol (Scheme 140).

Scheme 140. Intramolecular Jocic reaction to produce $\beta$-lactams.

Hydrazine compounds offer a potentially interesting extension to this type of reaction, as there should now be two competing nucleophiles in the Jocic reaction. Benzyl hydrazinecarboxylate was the first compound studied and the corresponding amide, 444, has the potential to form either a 4-membered ring ( $\beta$-lactam) or a 5-membered ring (pyrazolidin-3-one). Amide 444 was prepared by the ring opening of lactone $\mathbf{1 7 1}$ with hydrazine 443 , and was subsequently subjected to the standard Jocic conditions to yield either $\beta$-lactam 445 or pyrazolidin-3-one 446 (Scheme 141). Given that the product was not crystalline and that it was not possible to determine which structure was formed based on NMR data alone, we planned to couple $\beta$-lactam 445 or pyrazolidin-3-one 446 with a benzylamine compound in the hope that the amide would be crystalline for X-ray crystallography analysis (Scheme 142).

Scheme 141. Proposed synthesis of cyclic structures using an intramolecular Jocic reaction.

Scheme 142. Amide synthesis.

Unfortunately, of the amide derivatives synthesised, suitable crystals could not be grown. Attempts to remove the Cbz group to give a potentially more crystalline compound resulted in degradation of the material. However, by comparing the infrared data to the literature we were able to make a tentative assignment (Figure 18). ${ }^{434}$

Figure 18. Comparison of IR data to the literature.

The higher frequency absorption in the known compounds $\mathbf{4 5 0}$ and $\mathbf{4 5 1}$ can be assigned to the $\beta$ - and $\gamma$-lactam $\mathrm{C}=\mathrm{O}$ stretches, respectively. Compound $\mathbf{4 4 8}$ or $\mathbf{4 4 9}$ showed a highest $\mathrm{C}=\mathrm{O}$ stretch of $1787 \mathrm{~cm}^{-1} . \beta$-Lactam 448 is therefore the most likely structure based on the data available to us, although this is not conclusive evidence.

### 2.7.3 Readions with Oxygen Nudeophiles

Treatment of amide $\mathbf{4 2 8}$ with NaOH and $p$-methoxyphenol was anticipated to yield the phenoxy-substituted acid 452 (Scheme 143), since there was precedent in the literature for phenoxide to act as a nucleophile in the Jocic reaction. ${ }^{336,} 435$ Unfortunately, the reaction failed to give any identifiable products. Since the Bargellini reaction is almost exclusively the reaction of phenoxide nucleophiles with tertiary trichlorocarbinols (generated in situ), it is unclear as to why the reaction in scheme 143 should fail completely. The reason cannot be slower formation of the intermediate gem-dichloroepoxide since the rate of this step will be enhanced for tertiary trichlorocarbinols due to the Thorpe-Ingold effect. ${ }^{436,437}$

Scheme 143. Attempted Jocic reaction with 4-methoxyphenol.

The amide 453 was also synthesised as a substrate for the same reaction, by ring opening of lactone 171 with dibenzylamine (Scheme 144).

Scheme 144. Attempted Jocic reaction using an alternative amide.

Dibenzyl amide $\mathbf{4 5 3}$ should be more stable to alkaline hydrolysis than the potentially labile morpholine amides. Unfortunately, the Jocic reaction with this amide also failed to yield any identifiable products.

### 2.8 Condusions and Future Work

The asymmetric syntheses of both natural products $\alpha$-tocopherol and $\gamma$-tocopherol were completed. The asymmetric synthesis of $\gamma$-tocopherol had previously only been achieved by a gold-catalysed allylic substitution or by an enantioselective 1,2addition. Neither of these syntheses managed to achieve a high enantiomeric excess at the tertiary C-2 centre. In this sense, our work represents an improvement on the previously reported work since we were able to achieve $\geq 98 \%$ e.e. at the C-2 centre. The key step in the synthesis was an intramolecular Jocic reaction which proceeded with complete inversion and retained the $\geq 98 \%$ enantiomeric excess of the trichlorolactone starting material. Difficulties during the synthesis included the Friedel-Crafts ring opening of a $\beta$-lactone with a sterically hindered dimethoxybenzene, and the demethylation of aryl methyl ethers. The Friedel-Crafts reaction was found to be mediated by $\mathrm{TiCl}_{4}$ in high yield, whilst $\mathrm{BBr}_{3}$ was eventually used to remove the methyl ethers. Despite the strongly Lewis acidic nature of both reagents, no degradation of our substrate was observed. Trichlorocarbinols are particularly stable to acidic conditions due to the electron withdrawing $\mathrm{CCl}_{3}$ moiety. The later steps in the synthesis were known in the literature and proceeded smoothly.

The water-soluble vitamin E analogue ( $S$ )-Trolox could also be obtained by hydrolysis of one of the intermediate ester compounds. $\beta$-Tocopherol is also theoretically obtainable using the synthesis we developed, if 2,5-dimethyl-1,4-dimethoxybenzene is used as the arene starting material.

The reaction is a potentially useful general synthesis of tertiary chromanes which have been shown to be difficult to access in high enantiomeric excess by other methods. Aniline or thiphenol analogues should in theory yield 2-substituted tetrahydroquinolines and thiochromanes, respectively. Trichlorolactones with
different substitution patterns are known, and these would offer different substitution at the 2-position of the chromane ring.

In addition, attempts were made to expand the methodology to include inter- rather than intramolecular nucleophiles. The attempted addition of organometallic reagents to a morpholine amide containing the trichlorocarbinol group failed to give the expected ketone product, with the reaction instead yielding several unexpected compounds. Attempts to use $p$-methoxyphenol as a nucleophile in the Jocic reaction with this amide also failed to yield the expected $\alpha$-disubstituted carboxylic acid, whereas the intramolecular version gave reasonable yields of cyclised product during the synthesis of the tocopherols 1 and 3. Despite this lack of success, we felt that further studies using lactone $\mathbf{1 7 1}$ as a masked source of an enantiomerically enriched trichlorocarbinol were warranted as there were very few examples of this in the literature.

### 2.9 Experimental Section

All the reagents and solvents used were purchased from Sigma-Aldrich, Alfa-Aesar, TCI, Fluorochem or Acros Organics and were used as received unless stated otherwise. Solvents were dried over $3 \AA$ or $4 \AA$ molecular sieves where necessary.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AVII-700 MHz, AVIII HD-500 MHz , AVIII HD-400 MHz, AVIII HD-300 MHz or AV-300 MHz Fourier transform spectrometer, at room temperature unless stated otherwise. Chemical shifts are quoted in parts per million (ppm) downfield from tetramethylsilane. Solvents were used as an internal standard when assigning NMR spectra ( $\delta_{\mathrm{H}}: \mathrm{CDCl}_{3} 7.26 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD} 3.31$ $\mathrm{ppm},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO} 2.50 \mathrm{ppm}, \mathrm{D}_{2} \mathrm{O} 4.79 \mathrm{ppm} ; \delta_{\mathrm{C}}: \mathrm{CDCl}_{3} 77.1 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD} 49.0 \mathrm{ppm}$, $\left.\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO} 39.5 \mathrm{ppm}\right)$. Coupling constants $(J)$ are quoted in Hertz $(\mathrm{Hz})$ and rounded to the nearest 0.5 Hz . Abbreviations used in the descriptions of spectra are as follows; s $=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, quin. $=$ quintet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad. ${ }^{13} \mathrm{C}$ NMR spectra were recorded with proton decoupling and the spectra were assigned on the basis of COSY, PENDANT, HSQC and HMBC experiments.

Infrared spectra were recorded on a Bruker ALPHA platinum ATR spectrometer using OPUS software and are quoted in wavenumbers $\left(\mathrm{cm}^{-1}\right)$.

Optical rotations were recorded on an Optical Activity Ltd. AA-1000 millidegree autoranging polarimeter (using the sodium D line, 589 nm ) and $[\alpha]_{\mathrm{D}}$ values are given in units of $10^{-1} \mathrm{deg} \mathrm{cm}^{2} \mathrm{~g}^{-1}$. The samples were prepared using spectroscopic grade $\mathrm{CHCl}_{3}$ or MeOH .

HPLC data were obtained on a Varian Prostar 335LC detector using a Chiralcel Daicel AD-H column ( $4.6 \mathrm{~mm} \times 250 \mathrm{~mm}$ ), with a solvent system of $n$-hexane:2-propanol.

Melting points for solid crystalline products were determined using a Stuart Scientific SMP10 Digital Melting Point Apparatus, with a range given in ${ }^{\circ} \mathrm{C}$ and rounded to the nearest degree. The melting points are uncorrected.

Thin Layer Chromatography (TLC) was carried out using silica coated ( 0.25 mm ) alumina plates, and the plates were visualised using UV light or staining by $\mathrm{KMnO}_{4}$. Tocopherol-derived compounds are numbered according the following IUPAC system:

## 1,4-Dimethoxy-2,3,5-trimethylbenzene 364

The compound was prepared according to a method adapted from the literature. ${ }^{397}$ To a solution of trimethylhydroquinone $(10.0 \mathrm{~g}, 64.7 \mathrm{mmol})$ in acetone $(100 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(36.3 \mathrm{~g}, 263 \mathrm{mmol})$ and $\mathrm{MeI}(16.4 \mathrm{~mL}$, 263 mmol ) under nitrogen, and the mixture was stirred for 48 hours at reflux temperature. The solvent was removed in vacuo, water was added and the compound was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic layers were washed with water and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the solvent was removed in vacuo and the residue was purified by column chromatography (95:5 petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ) to give the product as a white solid ( $9.70 \mathrm{~g}, 82 \%$ ). $v\left(\mathrm{~cm}^{-1}\right)$; 2936 (C-H stretch), 1120 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.56(1 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\mathrm{H}), 3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.31\left(1 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{CH}_{3}\right), 2.23(1 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-$ $\left.\mathrm{CH}_{3}\right), 2.15\left(1 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 153.6\left(\mathrm{COCH}_{3}\right), 150.7$ $\left(\mathrm{COCH}_{3}\right), 130.7(\mathrm{Ph}-\mathrm{C}), 127.9(\mathrm{Ph}-\mathrm{C}), 123.6(\mathrm{Ph}-\mathrm{C}), 110.4(\mathrm{Ph}-\mathrm{CH}), 60.2\left(\mathrm{OCH}_{3}\right)$, $55.8\left(\mathrm{OCH}_{3}\right), 16.3\left(\mathrm{CH}_{3}\right), 12.7\left(\mathrm{CH}_{3}\right), 11.9\left(\mathrm{CH}_{3}\right)$; LRMS (ESI) $\mathrm{m} / \mathrm{z}:$ calcd. for $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{NaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+}$203.1, found 203.2; m.p $=35-36^{\circ} \mathrm{C}$. Data are consistent with that previously reported. ${ }^{397}$

## 1,4-Dimethoxy-2,3-dimethylbenzene 365

The compound was prepared according to a method adapted from the literature. ${ }^{397}$ To a solution of 1,4-dihydroxy-2,3-dimethylbenzene ( $6.03 \mathrm{~g}, 36.3 \mathrm{mmol}$ ) in acetone ( 60
mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(20.0 \mathrm{~g}$, 145 mmol$)$ and $\mathrm{MeI}(9.00 \mathrm{~mL}, 145 \mathrm{mmol})$ under nitrogen, and the mixture was stirred for 48 hours at reflux temperature. The solvent was removed in vacuo, water was added and the compound was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic layers were washed with water and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the solvent was removed in vacuo and the residue was purified by column chromatography (95:5 petroleum ether/ $\mathrm{Et}_{2} \mathrm{O}$ ) to yield product as a white solid ( 5.42 g , $79 \%$ ). v ( $\mathrm{cm}^{-1}$ ); 2952 (C-H stretch), 1094 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 6.76\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right.$ and $\left.\mathrm{H}_{6}\right), 3.89\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.32\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Ph}^{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 151.4\left(\mathrm{C}_{1}\right.$ and $\left.\mathrm{C}_{4}\right), 126.1\left(\mathrm{C}_{2}\right.$ and $\left.\mathrm{C}_{3}\right), 107.2\left(\mathrm{C}_{5}\right.$ and $\left.\mathrm{C}_{6}\right), 55.3\left(\mathrm{OCH}_{3}\right)$, $11.52\left(\mathrm{CH}_{3}\right)$; LRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{NaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+}$189.1, found 189.2; $\mathrm{m} . \mathrm{p}=78-79^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{438}$

## 1-Bromo-2,5-dimethoxy-3,4,6-trimethylbenzene 370

The compound was prepared according to a literature procedure. ${ }^{415}$ To a solution of 1,4-dimethoxy-2,3,5-trimethylbenzene $\mathbf{3 6 4}$ ( $0.36 \mathrm{~g}, 2.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{3} \mathrm{CN}(10 \mathrm{~mL})$ was added $N$-bromosuccinimide ( $0.53 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) and the mixture was stirred at room temperature for 2.5 hours. The solvent was removed in vacuo and the residue was extracted with $\mathrm{Et}_{2} \mathrm{O}$, washed with water and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ to yield product as an off-white solid which was used without further purification $(0.50 \mathrm{~g}$, $97 \%$ ). v ( $\mathrm{cm}^{-1}$ ); 2935 (alkyl C-H stretch), 1222 (C-O stretch), 753 (C-Br stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.65\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$, $2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.17\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 152.6(\mathrm{Ph}-\mathrm{C})$, 151.1 (Ph-C), 150.6 (Ph-C), 129.1 (Ph-C), 129.0 ( $\mathrm{Ph}-\mathrm{C}$ ), $117.0(\mathrm{Ph}-\mathrm{C}), 59.72\left(\mathrm{OCH}_{3}\right)$,
$59.61\left(\mathrm{OCH}_{3}\right), 15.93\left(\mathrm{CH}_{3}\right), 13.19\left(\mathrm{CH}_{3}\right), 12.50\left(\mathrm{CH}_{3}\right)$; LRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{11} \mathrm{H}_{15}{ }^{79} \mathrm{BrNaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+}$281.0, found 281.0; m.p $=70-71^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{415,439}$

## 1-Bromo-2,5-dimethoxy-3,4-dimethylbenzene 371

The compound was prepared according to a literature procedure. ${ }^{415}$ To a solution of 1,4-dimethoxy-2,3-dimethylbenzene $365(0.20 \mathrm{~g}, 1.2 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(5 \mathrm{~mL})$ was added N -bromosuccinimide (NBS) $(0.32 \mathrm{~g}, 1.8 \mathrm{mmol})$ and the mixture was stirred at room temperature for 45 minutes. The solvent was removed in vacuo and the residue was extracted with $\mathrm{Et}_{2} \mathrm{O}$, washed with water and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ to yield product to yield product as a pale yellow oil ( $292 \mathrm{mg}, 91 \%$ ) after column chromatography (95:5 petroleum ether/Et2 O ). v $\left(\mathrm{cm}^{-1}\right) ; 3018$ (C-H stretch), 1214 (CO stretch), 751 (C-H bend); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.86(1 \mathrm{H}, \mathrm{s}, \mathrm{Ph}-\mathrm{H}), 3.76$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.08\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 153.5$ (Ph-C), 148.7 ( $\mathrm{Ph}-\mathrm{C}$ ), 131.7 ( $\mathrm{Ph}-\mathrm{C}$ ), 125.2 ( $\mathrm{Ph}-\mathrm{C}$ ), 112.8 (Ph-C), $111.7(\mathrm{Ph}-\mathrm{CH}), 59.9\left(\mathrm{OCH}_{3}\right), 55.3\left(\mathrm{OCH}_{3}\right), 12.7\left(\mathrm{CH}_{3}\right), 11.5\left(\mathrm{CH}_{3}\right) ;$ LRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{10} \mathrm{H}_{13}{ }^{79} \mathrm{BrNaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+} 267.0$, found 267.1. Spectroscopic data are consistent with that previously reported. ${ }^{438}$

The compound was prepared according to a procedure adapted from the literature. ${ }^{395}$ To a solution of $\mathrm{AlCl}_{3}(0.632 \mathrm{~g}, 4.75 \mathrm{mmol})$ and 1,4-dimethoxybenzene 372 (1.38g, 10 mmol) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added a solution of ( $R$ )-(+)-4-methyl-4-(trichloromethyl)-2-oxetanone $171(0.203 \mathrm{~g}, 1.00 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$, at $0^{\circ} \mathrm{C}$. The mixture was warmed to room temperature and stirred overnight. The resulting solution was then cooled to $0{ }^{\circ} \mathrm{C}$, quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic fractions were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (95:5 petroleum ether/EtOAc to $1: 1$ ) to yield product as a yellow solid ( $0.292 \mathrm{~g}, 85 \%, \geq 98 \%$ e.e.). $v\left(\mathrm{~cm}^{-1}\right) ; 3444$ (br, O-H stretch), 1647 ( $\mathrm{C}=\mathrm{O}$ stretch), 1278 and 1030 (C-O stretch), 794.9 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.29$ ( $\left.1 \mathrm{H}, \mathrm{d}, J 3, \mathrm{H}_{6}{ }^{\prime}\right), 7.10\left(1 \mathrm{H}, \mathrm{dd}, J 9.5,3, \mathrm{H}_{4}{ }^{\prime}\right), 6.95\left(1 \mathrm{H}, \mathrm{d}, J 9, \mathrm{H}_{3}{ }^{\prime}\right), 5.49(1 \mathrm{H}, \mathrm{s}, \mathrm{OH})$, $3.92\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83(1 \mathrm{H}, \mathrm{d}, J 16, \mathrm{CHHCO}), 3.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.64(1 \mathrm{H}, \mathrm{d}, J$ 16.5, CHHCO ), $1.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 201.7(\mathrm{CO}), 153.7$ $\left(\mathrm{C}_{5}{ }^{\prime}\right), 153.3\left(\mathrm{C}_{2}{ }^{\prime}\right), 127.9\left(\mathrm{C}_{1}{ }^{\prime}\right), 121.6\left(\mathrm{C}_{4}{ }^{\prime}\right), 114.0\left(\mathrm{C}_{6}{ }^{\prime}\right), 113.4\left(\mathrm{C}_{3}{ }^{\prime}\right), 108.0\left(\mathrm{CCl}_{3}\right), 82.7$ $(\mathrm{C}(\mathrm{OH})), 56.2\left(\mathrm{OCH}_{3}\right), 55.9\left(\mathrm{OCH}_{3}\right), 46.7\left(\mathrm{CH}_{2}\right), 23.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right) ;$ HRMS (ESI) $\mathrm{m} / \mathrm{z}:$ calcd. for $\mathrm{C}_{13} \mathrm{H}_{15}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+} 362.9928$, found 362.9931 ; m.p $=89-91{ }^{\circ} \mathrm{C}$; $[\alpha]_{\mathrm{D}}$ ${ }^{30}+7.7\left(c 1, \mathrm{CHCl}_{3}\right)$. Enantiomeric excess was determined by chiral HPLC (Daicel

Chiralcel AD-H column, 2-propanol : hexane $=10: 90,1 \mathrm{~mL} / \mathrm{min}, 227 \mathrm{~nm},(R)$ isomer $14.81 \mathrm{~min},(S)$ isomer 16.33 min$).$

## 4,4,4-Trichloro-1-(2',5'-dimethoxyphenyl)-3-hydroxy-3-methylbutan-1-one ( $\pm$ )-

 373

A solution of diisopropylamine ( $1.40 \mathrm{~mL}, 10.0 \mathrm{mmol}$ ) in dry $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ was cooled to $-78{ }^{\circ} \mathrm{C}$ and $n$ - $\mathrm{BuLi}(3.60 \mathrm{~mL}, 9.16 \mathrm{mmol})$ was added dropwise. After stirring for 30 minutes at this temperature, 1-( $2^{\prime}, 5^{\prime}$-dimethoxyphenyl)ethan-1-one $\mathbf{3 8 1}$ ( 1.35 mL , $8.54 \mathrm{mmol})$ was added dropwise over 20 minutes. After stirring for one hour 1,1,1trichloroacetone ( $1.41 \mathrm{~mL}, 12.5 \mathrm{mmol}$ ) was added slowly over 20 minutes and the mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for a further three hours, before warming to room temperature and stirring overnight. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) $(20 \mathrm{~mL})$, extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the organic fractions were washed with water and brine. The solvent was removed in vacuo and the residue was purified by column chromatography ( $95: 5$ petroleum ether/EtOAc) to yield product as an off-white solid ( $1.63 \mathrm{~g}, 56 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3407$ (br, O-H stretch), 1643 ( $\mathrm{C}=\mathrm{O}$ stretch), 1261 and 1091 (C-O stretch), $787(\mathrm{C}-\mathrm{Cl}$ stretch $) ;{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.28\left(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 3, \mathrm{H}_{6}{ }^{\prime}\right)$, $7.09\left(1 \mathrm{H}, \mathrm{dd}, J 9,3, \mathrm{H}_{4}{ }^{\prime}\right), 6.95\left(1 \mathrm{H}, \mathrm{d}, J 9, \mathrm{H}_{3}{ }^{\prime}\right), 5.98(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.84(1 \mathrm{H}, \mathrm{d}, J 17, \mathrm{CHHCO}), 3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) 3.63(1 \mathrm{H}, \mathrm{d}, J 16.5, \mathrm{CHHCO}), 1.71$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{3}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 201.7(\mathrm{CO}), 153.7\left(\mathrm{C}_{5}{ }^{\prime}\right), 153.2\left(\mathrm{C}_{2}{ }^{\prime}\right)$, $127.9\left(\mathrm{C}_{1}{ }^{\prime}\right), 121.6\left(\mathrm{C}_{4}{ }^{\prime}\right), 114.0\left(\mathrm{C}_{6}{ }^{\prime}\right), 113.4\left(\mathrm{C}_{3}{ }^{\prime}\right), 108.0\left(\mathrm{CCl}_{3}\right), 82.7(\mathrm{C}(\mathrm{OH})), 56.2$ $\left(\mathrm{C}_{2}{ }^{\prime}-\mathrm{OCH}_{3}\right), 55.9\left(\mathrm{C}_{5}{ }^{\prime}-\mathrm{OCH}_{3}\right), 46.7\left(\mathrm{CH}_{2}\right), 23.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$; HRMS (ESI) m/z: calcd. for $\mathrm{C}_{13} \mathrm{H}_{15}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+} 362.9928$, found 362.9925 ; m.p $=105-106^{\circ} \mathrm{C}$.

The compound was prepared according to a procedure adapted from the literature. ${ }^{400}$ To a solution of (R)-4,4,4-trichloro-1-(2',5'-dimethoxyphenyl)-3-hydroxy-3-methylbutan-1-one 373 ( $0.751 \mathrm{~g}, 2.20 \mathrm{mmol}$ ) and sodium iodide $(1.98 \mathrm{~g}, 13.2 \mathrm{mmol})$ in dry $\mathrm{CH}_{3} \mathrm{CN}(10 \mathrm{~mL})$ was added chlorotrimethylsilane ( $1.44 \mathrm{~g}, 13.2 \mathrm{mmol}$ ), slowly with continuous stirring under nitrogen. The reaction mixture was heated to $70^{\circ} \mathrm{C}$ for 60 hours, before being quenched with water and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was washed with $5 \%$ sodium thiosulfate (aq.), brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. ## 4-Hydroxy-2,3,5-trimethylphenyl pivalate 383

The compound was prepared according to a literature procedure. ${ }^{216}$ To a suspension of trimethylhydroquinone ( $5.00 \mathrm{~g}, 32.9 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL})$ was added pyridine $(8.33 \mathrm{~mL}, 105 \mathrm{mmol})$ and the mixture was cooled to $0^{\circ} \mathrm{C}$. Pivaloyl chloride ( 4.25 mL , $34.5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was then added dropwise over 45 minutes and the solution was stirred at room temperature for an additional 18 hours, after which time it was washed with 2 M HCl (aq.), $5 \% \mathrm{NaHCO}_{3}$ (aq.) and brine. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo to yield crude product as an orange solid $(7.04 \mathrm{~g})$. This solid was recrystallised in petroleum ether to give product as a white crystalline solid ( $4.81 \mathrm{~g}, 62 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3490$ (br, O-H stretch), 1730 (C=O stretch), 1135 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.56(1 \mathrm{H}, \mathrm{s}$, Ph-H), $5.00(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.12\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.09\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.01\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 1.39$ $\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 177.3\left(\mathrm{CO}_{2}\right), 149.2$ (Ar-C), 141.7 (Ar-C), 126.5 (Ar-C), 123.2 (Ar-C), 120.5 ( $\mathrm{Ar}-\mathrm{C}), 120.0(\mathrm{Ar}-\mathrm{C}), 38.6\left(C\left(\mathrm{CH}_{3}\right)_{3}\right), 26.7$ $\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 15.3\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 12.0\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 11.6\left(\mathrm{Ar}-\mathrm{CH}_{3}\right)$; LRMS (ESI) $m / z$ : calcd. for
$\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{NaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+} 259.1$, found 259.1; m.p $=123-124{ }^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{216}$

## 4-Methoxy-2,3,5-trimethylphenol 384

The compound was prepared according to a literature procedure. ${ }^{216}$ To a solution of 4-hydroxy-2,3,5-trimethylphenyl 2,2-dimethylpropanoate 383 (14.2 g, 60.3 mmol ) in acetone $(150 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(16.7 \mathrm{~g}, 121 \mathrm{mmol})$ and $\mathrm{MeI}(11.3 \mathrm{~mL}, 181 \mathrm{mmol})$ under nitrogen, and the mixture was stirred at reflux temperature for 48 hours. After cooling to room temperature, the solids were filtered off and washed with acetone, the filtrate was removed in vacuo and the residue was taken up in $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ (aq.), water and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to yield the methyl ether as an orange oil ( $12.7 \mathrm{~g}, 84 \%$ ), which was used directly in the next step without further purification. $v\left(\mathrm{~cm}^{-1}\right) ; 2973(\mathrm{C}-\mathrm{H}$ stretch), 1746 (C=O stretch), 1117 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.65$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{Ph}-\mathrm{H}), 3.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.25\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.21\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.02(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right), 1.38\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 177.2\left(\mathrm{CO}_{2}\right)$, $154.4(\mathrm{Ar}-$ C), 145.1 (Ar-C), 130.9 (Ar-C), 128.8 (Ar-C), 127.4 (Ar-C), 121.0 (Ar-C), 60.0 $\left(\mathrm{OCH}_{3}\right), 39.1\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 27.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 16.0\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 12.7\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 12.6(\mathrm{Ar}-$ $\mathrm{CH}_{3}$ ); LRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{NaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+}$273.1, found 272.8. Spectroscopic data are consistent with that previously reported. ${ }^{216}$

To a solution of 4-methoxy-2,3,5-trimethylphenyl pivalate ( $5.0 \mathrm{~g}, 20 \mathrm{mmol}$ ) in MeOH $(30 \mathrm{~mL})$ was added a solution of $\mathrm{KOH}(1.8 \mathrm{~g}, 32 \mathrm{mmol})$ in water $(10 \mathrm{~mL})$ and the mixture was stirred at reflux temperature for six hours, then at room temperature
overnight. The solvent was then removed in vacuo and the residue was diluted with water and acidified with 2 M HCl (aq.). The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the organic fractions were washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ (aq.), brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ to give crude product as a dark brown oil. Further purification by column chromatography (8:2 petroleum ether/EtOAc) yielded product as a yellow solid after drying under high vacuum ( $3.14 \mathrm{~g}, 95 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3404$ (br, O-H stretch), 1224 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.43(1 \mathrm{H}, \mathrm{s}, \mathrm{Ph}-\mathrm{H}), 5.44(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.69$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.22\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 150.3$ (Ar-C), 149.7 (Ar-C), 130.7 (Ar-C), 128.3 (Ar-C), 121.4 ( $\mathrm{Ar}-\mathrm{C}$ ), $114.6(\mathrm{Ar}-\mathrm{C}), 60.8\left(\mathrm{OCH}_{3}\right), 16.0\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 12.7\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 11.9\left(\mathrm{Ar}-\mathrm{CH}_{3}\right)$; LRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{NaO}_{2}[\mathrm{M}+\mathrm{Na}]^{+} 189.1$, found 189.0; m.p $=50-51$ ${ }^{\circ} \mathrm{C}$. ## (S)-(6-(Benzyloxy)-2,5,7,8-tetramethylchroman-2-yl)methanol 390

389

390

The compound was prepared according to a literature procedure. ${ }^{140}$ To a stirred suspension of $\mathrm{LiAlH}_{4}(80.0 \mathrm{mg}, 2.03 \mathrm{mmol})$ in dry THF ( 6 mL ) was added dropwise methyl ( $S$ )-6-(benzyloxy)-2,5,7,8-tetramethylchromane-2-carboxylate 389 ( 0.240 g , 0.678 mmol ), under nitrogen and at $0^{\circ} \mathrm{C}$. The solution was stirred at $0^{\circ} \mathrm{C}$ for one hour then at room temperature for a further two hours. The reaction was cooled to $0^{\circ} \mathrm{C}$ and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.), then filtered through celite. The filtrate was concentrated in vacuo, the residue was taken up in EtOAc and washed with brine and water. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and solvent was removed in vacuo. The crude residue was purified by column chromatography (3:1 petroleum ether/EtOAc) to yield product as a white solid ( $0.183 \mathrm{~g}, 83 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3403$ (br, OH stretch), 1254, 1085 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.53-7.30(5 \mathrm{H}$, m, Ph-H), $4.70\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 3.66(1 \mathrm{H}, \mathrm{d}, J 11.5, \mathrm{CHHOH}), 3.60(1 \mathrm{H}, \mathrm{d}, J 11.5$, $\mathrm{CHHOH}), 2.72-2.58\left(2 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2}\right), 2.27\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{7}-\mathrm{CH}_{3}\right), 2.18\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{5}-\mathrm{CH}_{3}\right), 2.11$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{8}-\mathrm{CH}_{3}\right), 2.02\left(1 \mathrm{H}, \operatorname{ddd}, J 13.5,10,7, \mathrm{ArCH}_{2} \mathrm{CHH}\right), 1.74(1 \mathrm{H}$, ddd, $J 13.5,6$, 4.5, $\left.\mathrm{ArCH}_{2} \mathrm{CHH}\right), 1.24\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 148.7\left(\mathrm{C}_{6}\right)$,

## 4,4,4-Trichloro-1-(2',5'-dimethoxy-3',4'-dimethylphenyl)-3-hydroxy-3-methylbutan-1-one ( $\pm$ )-367

A solution of diisopropylamine ( $1.74 \mathrm{~mL}, 12.4 \mathrm{mmol}$ ) in dry $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{~mL})$ was cooled to $-78^{\circ} \mathrm{C}$ and $n-\mathrm{BuLi}(2.5 \mathrm{M}, 4.52 \mathrm{~mL}, 11.3 \mathrm{mmol})$ was added dropwise. After stirring for 30 minutes at this temperature, 1-( $2^{\prime}, 5^{\prime}$ 'dimethoxy- $3^{\prime}, 4^{\prime}$-dimethylphenyl)ethan-1one ( $2.15 \mathrm{~g}, 10.3 \mathrm{mmol}$ ) was added dropwise over 20 minutes. After stirring for one hour 1,1,1-trichloroacetone ( $1.75 \mathrm{~mL}, 15.5 \mathrm{mmol}$ ) was added slowly over 20 minutes and the mixture was stirred at $-78^{\circ} \mathrm{C}$ for a further three hours, before warming to room temperature and stirring overnight. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) $(20 \mathrm{~mL})$, extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the organic fractions were washed with water and brine. The solvent was removed in vacuo and the residue was purified by column chromatography yield product as a yellow oil ( $1.97 \mathrm{~g}, 52 \%$ ) after column chromatography ( $100 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) . v ( $\mathrm{cm}^{-1}$ ); 3442 (br, O-H stretch), 1654 ( $\mathrm{C}=\mathrm{O}$ stretch), 1100 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.00(1 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{H}), 5.53$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.85(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 17, \mathrm{CHHCO}), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}{ }^{\prime}-\mathrm{OCH}_{3}\right), 3.73(1 \mathrm{H}, \mathrm{d}, J 16.5$, $\mathrm{CH} H \mathrm{CO}), 3.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{5}{ }^{\prime}-\mathrm{OCH}_{3}\right), 2.24\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{3}{ }^{\prime}-\mathrm{CH}_{3}\right), 2.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{4}{ }^{\prime}-\mathrm{CH}_{3}\right), 1.70$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{3}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 202.9(\mathrm{CO}), 154.2\left(\mathrm{C}_{5}{ }^{\prime}\right), 152.3\left(\mathrm{C}_{2}{ }^{\prime}\right)$, $133.8\left(\mathrm{C}_{4}{ }^{\prime}\right), 132.4\left(\mathrm{C}_{3}{ }^{\prime}\right), 129.6\left(\mathrm{C}_{1}{ }^{\prime}\right), 108.0\left(\mathrm{CCl}_{3}\right), 107.9\left(\mathrm{C}_{6}{ }^{\prime}\right), 82.6\left(\mathrm{C}_{3}\right), 62.7\left(\mathrm{C}_{2}{ }^{\prime}-\right.$ $\left.\mathrm{OCH}_{3}\right), 55.9\left(\mathrm{C}_{5}{ }^{\prime}-\mathrm{OCH}_{3}\right), 46.3\left(\mathrm{CH}_{2}\right), 23.7\left(\mathrm{C}_{3}-\mathrm{CH}_{3}\right), 12.9\left(2 \mathrm{x} \mathrm{Ar}-\mathrm{CH}_{3}\right) ;$ HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{15} \mathrm{H}_{19}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+} 391.0241$, found 391.0238.

## Methyl (S)-6-hydroxy-2,7,8-trimethyl-4-oxochromane-2-carboxylate 411

To a solution of (R)-4,4,4-trichloro-1-(2', $5^{\prime}$-dimethoxy-3',4'-dimethylphenyl)-3-hydroxy-3-methylbutan-1-one $367(0.240 \mathrm{~g}, 0.649 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added $\mathrm{BBr}_{3}(0.250 \mathrm{~mL}, 2.60 \mathrm{mmol})$ at $-78{ }^{\circ} \mathrm{C}$ under nitrogen, and the mixture was warmed to room temperature and stirred overnight. After this time the reaction was quenched with water and the solvent was removed under a flow of nitrogen. To obtain the best yields, the crude mixture of hydroquinone $\mathbf{4 1 0}$ was reacted immediately in the next step. To a deoxygenated solution of crude ( $R$ )-4,4,4-trichloro-1-( $2^{\prime}, 5$ '-dihydroxy-3',4'-dimethylphenyl)-3-hydroxy-3-methylbutan-1-one 410 in THF ( 5 mL ) was added deoxygenated 2 M NaOH (aq.) until the solution reached a pH of $\geq 12(5 \mathrm{~mL}, 10.0$ mmol ), and the mixture was stirred under nitrogen at room temperature overnight. The resulting alkaline solution was washed three times with $\mathrm{Et}_{2} \mathrm{O}$, acidified to pH 2 with 1 M HCl (aq.) and extracted with EtOAc. The combined organic fractions were washed with pH 2 buffer and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to yield product as a brown crystalline solid which was used in the next step without further purification. A sample of the acid for analysis could be obtained by column chromatography (8:2:0.1 EtOAc/MeOH/AcOH).v (cm ${ }^{-1}$ ); 3392 (br, O-H stretch), 1735 (acid C=O stretch), 1602 (ketone $\mathrm{C}=\mathrm{O}$ stretch), 1236 and 1085 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ((CD $\left.\left.)_{2}\right)_{2} \mathrm{SO}, 500 \mathrm{MHz}\right) \delta 6.95\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right), 2.95(1 \mathrm{H}, \mathrm{d}, J 17, \mathrm{CHHCO}), 2.88(1 \mathrm{H}$,

## Methyl 6-hydroxy-2,7,8-trimethyl-4-oxochromane-2-carboxylate ( $\pm$ )-411

$( \pm)-411$

4,4,4-Trichloro-1-(2',5'-dihydroxy-3',4'-dimethylphenyl)-3-hydroxy-3-methylbutan1 -one $( \pm)-\mathbf{4 1 0}$ was prepared according to a procedure adapted from the literature. ${ }^{400}$ To a solution of 4,4,4-trichloro-1-(2',5'-dimethoxy-3',4'-dimethylphenyl)-3-hydroxy-3-methylbutan-1-one $( \pm)-\mathbf{3 6 7}(0.770 \mathrm{~g}, 2.08 \mathrm{mmol})$ and sodium iodide (2.19 $\mathrm{g}, 14.6 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{3} \mathrm{CN}(25 \mathrm{~mL})$ was added chlorotrimethylsilane ( $1.86 \mathrm{~mL}, 14.6$ mmol), slowly with continuous stirring under nitrogen. The reaction mixture was heated to $70{ }^{\circ} \mathrm{C}$ for 60 hours, before being quenched with water and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was washed with $5 \%$ sodium thiosulfate (aq.), brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude hydroquinone $( \pm)-\mathbf{4 1 0}$ was not isolated and was used in the next step without further purification. To a deoxygenated solution of crude 4,4,4-trichloro-1-(2',5'-dihydroxy-3', 4'-dimethylphenyl)-3-hydroxy-3-methylbutan-1-one $( \pm)-\mathbf{4 1 0}$ in THF ( 10 mL ) was added deoxygenated 2 M NaOH (aq.) until the solution reached a pH of $\geq 12(10 \mathrm{~mL}, 20.0 \mathrm{mmol})$, and the mixture was stirred under nitrogen at room temperature overnight. The resulting alkaline solution was washed three times with $\mathrm{Et}_{2} \mathrm{O}$, acidified to pH 2 with 1 M HCl (aq.) and extracted with EtOAc. The combined organic fractions were washed with pH 2 buffer and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to yield product as a brown crystalline solid which was used in the next step without further purification. A pure sample of the acid for analysis
could be obtained by column chromatography ( $100 \%$ EtOAc to 8:2:0.1 EtOAc/MeOH/AcOH).v ( $\mathrm{cm}^{-1}$ ); 3412 (br, O-H stretch), 1707 (acid $\mathrm{C}=\mathrm{O}$ stretch), 1671 (ketone $\mathrm{C}=\mathrm{O}$ stretch), 1204 and 1088 (C-O stretches); ${ }^{1} \mathrm{H}$ NMR (( $\left.\mathrm{CD}_{3}\right)_{2} \mathrm{SO}, 500$ $\mathrm{MHz}) \delta 9.28(1 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{OH}), 6.95\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right), 2.95(1 \mathrm{H}, \mathrm{d}, J 17, \mathrm{CHHCO}), 2.91(1 \mathrm{H}$, $\mathrm{d}, J 17, \mathrm{CH} H \mathrm{CO}), 2.14\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{8}-\mathrm{CH}_{3}\right), 2.11\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{7}-\mathrm{CH}_{3}\right), 1.62\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right)$; ${ }^{13} \mathrm{C}$ NMR $\left(\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}, 125 \mathrm{MHz}\right) \delta 191.0(\mathrm{CO}), 174.0\left(\mathrm{CO}_{2}\right), 152.0\left(\mathrm{C}_{6}\right), 149.9\left(\mathrm{C}_{8 \mathrm{a}}\right)$, $133.7\left(\mathrm{C}_{4 \mathrm{a}}\right), 126.8\left(\mathrm{C}_{7}\right.$ or $\left.\mathrm{C}_{8}\right), 118.1\left(\mathrm{C}_{7}\right.$ or $\left.\mathrm{C}_{8}\right), 106.7\left(\mathrm{C}_{5}\right), 81.3\left(\mathrm{C}_{2}\right), 45.6\left(\mathrm{CH}_{2}\right), 25.2$ $\left(\mathrm{C}_{2}-\mathrm{CH}_{3}\right), 13.3\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right), 12.3\left(\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$; HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{NaO}_{5}$ $[\mathrm{M}+\mathrm{Na}]^{+} 273.0733$, found $273.0729 ; \mathrm{m} . \mathrm{p}=263-264^{\circ} \mathrm{C}$.

Crude 6-hydroxy-2,7,8-trimethyl-4-oxochromane-2-carboxylic acid was dissolved in 2 M methanolic $\mathrm{HCl}(5 \mathrm{~mL})$ and stirred at room temperature overnight. The solvent was removed in vacuo and the residue was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the combined organic fractions were washed with water and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. ## Methyl (S)-6-hydroxy-2,7,8-trimethylchromane-2-carboxylate 412

To a solution of methyl ( $S$ )-6-hydroxy-2,7,8-trimethyl-4-oxochromane-2-carboxylate $411(0.550 \mathrm{~g}, 1.98 \mathrm{mmol})$ in $\mathrm{MeOH}(25 \mathrm{~mL})$ was added fine zinc powder $(1.36 \mathrm{~g}, 20.8$ $\mathrm{mmol})$ and concentrated $\mathrm{HCl}(4.30 \mathrm{~mL}, 52.0 \mathrm{mmol})$ and stirred at room temperature for five hours. After filtering through celite, the filtrate was concentrated in vacuo. The resulting residue was taken up with $\mathrm{Et}_{2} \mathrm{O}$ and washed with brine. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude material was purified by column chromatography ( $85: 15$ petroleum ether/EtOAc) to yield product as a white solid ( $0.406 \mathrm{~g}, 78 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3447$ (br, O-H stretch), 1729 (C=O stretch), 1190 and $1107\left(\mathrm{C}-\mathrm{O}\right.$ stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.31(1 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{H}_{5}\right), 4.34(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 2.66-2.58\left(2 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2}\right), 2.35(1 \mathrm{H}$, ddd, $J$ 13.5, 6, 4.5, $\mathrm{ArCH}_{2} \mathrm{CHH}$ ), $2.18\left(3 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{CH}_{3}\right), 2.13\left(3 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{CH}_{3}\right), 1.85$ $\left(1 \mathrm{H}\right.$, ddd, $\left.J 17.5,9.5,8, \mathrm{ArCH}_{2} \mathrm{CHH}\right), 1.60\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125\right.$ $\mathrm{MHz}) \delta 174.6\left(\mathrm{CO}_{2}\right), 147.1\left(\mathrm{C}_{8 \mathrm{a}}\right), 145.7\left(\mathrm{C}_{6}\right), 125.9\left(\mathrm{C}_{7}\right.$ or $\left.\mathrm{C}_{8}\right), 122.1\left(\mathrm{C}_{4 \mathrm{a}}\right), 118.0\left(\mathrm{C}_{7}\right.$ or $\left.\mathrm{C}_{8}\right), 112.1\left(\mathrm{C}_{5}\right), 77.9\left(\mathrm{C}_{2}\right), 52.5\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right), 30.7\left(\mathrm{C}_{3}\right), 25.7\left(\mathrm{C}_{4}\right), 22.8\left(\mathrm{C}_{2}-\mathrm{CH}_{3}\right), 12.1$ $\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$, $12.0\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$; HRMS (ESI) m/z: calcd. for $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+} 273.1097$, found 273.1102; m.p $=104-105{ }^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}-81.7(c$ $\left.0.06, \mathrm{CHCl}_{3}\right)$.

## Methyl (S)-6-(benzyloxy)-2,7,8-trimethylchromane-2-carboxylate 413

The compound was prepared according to a literature procedure. ${ }^{140}$ To a solution of methyl ( $S$ )-6-hydroxy-2,7,8-trimethylchromane-2-carboxylate 412 ( $0.400 \mathrm{~g}, 0.573$ mmol) in DMF ( 5 mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(0.330 \mathrm{~g}, 2.40 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ and stirred for 20 minutes. Benzyl bromide ( $0.285 \mathrm{~mL}, 2.40 \mathrm{mmol}$ ) was then added dropwise and the mixture was stirred at room temperature overnight. The reaction was diluted with water and EtOAc and the aqueous layer was extracted with EtOAc. The combined organic fractions were washed thoroughly with water and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo and residue was purified by column chromatography (95:5 petroleum ether/EtOAc) to yield product as a white solid ( $0.340 \mathrm{~g}, 63 \%$ ). $v\left(\mathrm{~cm}^{-}\right.$ ${ }^{1}$ ); 1727 (C=O stretch), 1206 and 1101 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ 7.46-7.41 (2H, m, Ph-H), 7.40-7.35 (2H, m, Ph-H), 7.34-7.29 (1H, m, Ph-H), 6.44 $\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right), 5.00\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 3.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 2.73-2.62\left(2 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2}\right)$, 2.38 (1H, ddd, J 13.5, 5.5, 4.5, $\mathrm{ArCH}_{2} \mathrm{CHH}$ ), $2.20\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{7}-\mathrm{CH}_{3}\right), 2.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{8}-\right.$ $\left.\mathrm{CH}_{3}\right), 1.87\left(1 \mathrm{H}\right.$, ddd, $\left.J 13.5,10,7.5, \mathrm{ArCH}_{2} \mathrm{CH} H\right), 1.61\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 174.5\left(\mathrm{CO}_{2}\right), 150.6\left(\mathrm{C}_{8 \mathrm{a}}\right), 145.9\left(\mathrm{C}_{6}\right), 138.0(\mathrm{Ph}-\mathrm{C}), 128.4(\mathrm{Ph}-$ C), 127.6 ( $\mathrm{Ph}-\mathrm{C}$ ), $127.2(\mathrm{Ph}-\mathrm{C}), 125.9\left(\mathrm{C}_{8}\right), 125.1\left(\mathrm{C}_{4 \mathrm{a}}\right), 117.1\left(\mathrm{C}_{7}\right), 109.9\left(\mathrm{C}_{5}\right), 77.8$ $\left(\mathrm{C}_{2}\right), 70.8\left(\mathrm{OCH}_{2}\right), 52.4\left(\mathrm{CO}_{2} \mathrm{CH}_{3}\right), 30.6\left(\mathrm{C}_{3}\right), 25.5\left(\mathrm{C}_{2}-\mathrm{CH}_{3}\right), 23.0\left(\mathrm{C}_{4}\right), 12.1\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right), 12.0\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$; HRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{NaO}_{4}$ $[\mathrm{M}+\mathrm{Na}]^{+} 363.1567$, found 363.1570; m.p $=56-57^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}-31.1\left(c 0.42, \mathrm{CHCl}_{3}\right)$.

## (S)-(6-(Benzyloxy)-2,7,8-trimethylchroman-2-yl)methanol 414

The compound was prepared according to a literature procedure. ${ }^{140}$ To a stirred suspension of $\mathrm{LiAlH}_{4}(0.109 \mathrm{~g}, 2.87 \mathrm{mmol})$ in dry THF ( 8 mL ) was added dropwise methyl (S)-6-(benzyloxy)-2,7,8-trimethylchromane-2-carboxylate 413 ( $0.325 \mathrm{~g}, 0.956$ mmol), under nitrogen and at $0^{\circ} \mathrm{C}$. The solution was stirred at $0^{\circ} \mathrm{C}$ for one hour then at room temperature for a further two hours. The reaction was cooled to $0{ }^{\circ} \mathrm{C}$ and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.), then filtered through celite. The filtrate was concentrated in vacuo, the residue was taken up in EtOAc and washed with brine and water. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and solvent was removed in vacuo. The resulting white solid was used without further purification $(0.250 \mathrm{~g}, 84 \%)$. $v\left(\mathrm{~cm}^{-1}\right) ; 3458$ (br, O-H stretch), 1229 and 1098 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$ MHz) $\delta$ 7.47-7.43 (2H, m, Ph-H), 7.41-7.36 (2H, m, Ph-H), 7.34 (1H, m, Ph-H), 6.52 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}$ ), $4.98\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 3.65(1 \mathrm{H}, \mathrm{dd}, J 11.5,6.5, \mathrm{CHHOH}), 3.60(1 \mathrm{H}, \mathrm{dd}, J$ $11.5,7, \mathrm{CH} H \mathrm{OH}), 2.81$ (1H, ddd, $J 16.5,10.5,6, \mathrm{ArCHH}), 2.71$ (1H, dt, $J 16.5,5.5$, $\mathrm{ArCH} H), 2.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{7}-\mathrm{CH}_{3}\right), 2.13\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{8}-\mathrm{CH}_{3}\right), 2.00(1 \mathrm{H}, \mathrm{ddd}, J 13.5,10.5,6$, $\left.\mathrm{ArCH}_{2} \mathrm{CHH}\right), 1.90(1 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{OH}), 1.68\left(1 \mathrm{H}\right.$, ddd, $\left.J 13.5,6.5,4.5, \mathrm{ArCH}_{2} \mathrm{CHH}\right)$, $1.25\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 150.5\left(\mathrm{C}_{6}\right), 145.5\left(\mathrm{C}_{8 \mathrm{a}}\right), 138.1$ (Ph-C), 128.6 (Ph-C), 127.8 (Ph-C), 127.4 (Ph-C), 126.1 ( $\mathrm{C}_{4 \mathrm{a}}$ ), 125.3 ( $\mathrm{C}_{7}$ ), 117.7 ( $\mathrm{C}_{8}$ ), $110.4\left(\mathrm{C}_{5}\right), 76.2\left(\mathrm{C}_{2}\right), 71.1\left(\mathrm{PhCH}_{2} \mathrm{O}\right), 69.7\left(\mathrm{CH}_{2} \mathrm{OH}\right), 28.0\left(\mathrm{C}_{3}\right), 22.4\left(\mathrm{C}_{4}\right), 20.9\left(\mathrm{C}_{2}-\right.$ $\left.\mathrm{CH}_{3}\right)$, $12.2\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$, $12.1\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ or $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right)$; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd.
for $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{NaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+} 335.1618$, found 335.1620; m.p $=123-124{ }^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}+22.5$ (c $0.14, \mathrm{CHCl}_{3}$ ). Spectroscopic data are consistent with that previously reported. ${ }^{442}$ (S)-6-(Benzyloxy)-2,7,8-trimethylchromane-2-carbaldehyde 415

To a solution of IBX $(0.188 \mathrm{~g}, 0.673 \mathrm{mmol})$ in DMSO $(4 \mathrm{~mL})$ was added a solution of (S)-(6-(benzyloxy)-2,7,8-trimethylchroman-2-yl)methanol 414 ( $0.140 \mathrm{~g}, 0.448 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ and the solution was stirred at room temperature overnight. The mixture was filtered through celite with EtOAc and the filtrate was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography ( $95: 5$ petroleum ether/EtOAc) to yield product as an off-white solid ( $90 \mathrm{mg}, 65 \%$ ). v ( $\mathrm{cm}^{-1}$ ); 1739 ( $\mathrm{C}=\mathrm{O}$ stretch), 1102 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 9.65(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.47-7.43(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 7.42-7.37$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}$ ), $7.35(1 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 6.47\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right), 4.98\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 2.72-2.66$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2}\right), 2.27-2.19\left(1 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2} \mathrm{CHH}\right), 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{Ar}^{2}-\mathrm{CH}_{3}\right), 2.22(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Ar}-\mathrm{CH}_{3}\right), 1.86-1.78\left(1 \mathrm{H}, \mathrm{m}, \mathrm{ArCH}_{2} \mathrm{CH} H\right), 1.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 204.6(\mathrm{CHO}), 151.0\left(\mathrm{C}_{6}\right), 145.6\left(\mathrm{C}_{8 \mathrm{a}}\right), 137.9(\mathrm{Ph}-\mathrm{C}), 128.6$ (Ph-C), 127.8 (Ph-C), 127.3 (Ph-C), $126.3\left(\mathrm{C}_{4 \mathrm{a}}\right), 125.5\left(\mathrm{C}_{7}\right), 117.4\left(\mathrm{C}_{8}\right), 110.1\left(\mathrm{C}_{5}\right), 81.1\left(\mathrm{C}_{2}\right), 70.9$ $\left(\mathrm{OCH}_{2}\right), 28.0\left(\mathrm{C}_{3}\right), 22.4\left(\mathrm{C}_{4}\right), 21.9\left(\mathrm{C}_{2}-\mathrm{CH}_{3}\right), 12.2\left(\mathrm{C}_{7}-\mathrm{CH}_{3}\right.$ and $\left.\mathrm{C}_{8}-\mathrm{CH}_{3}\right) ;$ HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{NaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+} 333.1461$, found 333.1461; m.p $=95-96^{\circ} \mathrm{C}$; $[\alpha]_{\mathrm{D}}{ }^{25}+15\left(c 0.04, \mathrm{CHCl}_{3}\right)$.

## (2S, $\mathbf{4}^{\prime} R, 8^{\prime} R$ )-6-(Benzyloxy)-2,7,8-trimethyl-2-( $\mathbf{4}^{\prime}, \mathbf{8}^{\prime}, 12^{\prime}$-trimethyltridec-1-en-1-

## yl)chromane 416

To a solution of triphenyl((3R,7R)-3,7,11-trimethyldodecyl)phosphonium iodide 392 ( $0.612 \mathrm{~g}, 1.02 \mathrm{mmol}$ ) in dry THF ( 5 mL ) was added $n-\operatorname{BuLi}(2.23 \mathrm{M}, 0.460 \mathrm{~mL}, 0.957$ $\mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ under nitrogen. After stirring for one hour at this temperature a solution of (S)-6-(benzyloxy)-2,7,8-trimethylchromane-2-carbaldehyde 415 ( $90.0 \mathrm{mg}, 0.290$ mmol) in THF ( 5 mL ) was added dropwise and the solution was stirred at room temperature for two hours. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) and extracted with $\mathrm{Et}_{2} \mathrm{O}$, the combined organic fractions were washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. To remove triphenylphosphine (present due to incomplete conversion in the synthesis of phosphonium salt 392) the residue was dissolved in THF ( 2 mL ) and MeI ( $50.0 \mu \mathrm{~L}$, 0.800 mmol ) was added. This mixture was stirred at room temperature until the triphenylphosphine was consumed as monitored by TLC. The solids were filtered off and the crude residue was purified by column chromatography ( $100 \%$ petroleum ether to $97.5: 2.5$ petroleum ether/EtOAc) to yield product as a colourless oil ( $61 \mathrm{mg}, 42 \%$ ), as a mixture of cis/trans isomers. $v\left(\mathrm{~cm}^{-1}\right) ; 2924$ (C-H stretch), 1231 and 1098 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.49-7.28(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 6.49\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{5}\right)$, $5.85(1 \mathrm{H}, \mathrm{dd}, J 17.5,11$, trans $\mathrm{CH}=\mathrm{CH}), 5.53-5.29(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CH}), 4.96(2 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{2}$ ), 2.79 ( $\left.1 \mathrm{H}, \mathrm{ddd}, J 16.5,10,6, \mathrm{ArCHH}\right), 2.63(1 \mathrm{H}, \mathrm{dt}, J 16,5, \mathrm{ArCH} H), 2.67-$ $2.14(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CHCHH}), 2.18,\left(3 \mathrm{H}, \mathrm{s}, \mathrm{Ar}^{2}-\mathrm{CH}_{3}\right), 2.17\left(3 \mathrm{H}, \mathrm{s}, \mathrm{Ar}^{2}-\mathrm{CH}_{3}\right), 2.01(1 \mathrm{H}$, ddd, $J$ 14.5, 5.5, 4, CH=CHCHH), 1.96 (1H, ddd, J 13.5, 5.5, 5, $\mathrm{ArCH}_{2} \mathrm{CHH}$ ), 1.74 (1H, ddd, J 16, 10.5, 5.5, $\left.\mathrm{ArCH}_{2} \mathrm{CH} H\right), 1.56-1.46\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{4}{ }^{\prime}\right), 1.49\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{2}-\mathrm{CH}_{3}\right)$,

## ( $R$ )-4,4,4-Trichloro-3-hydroxy-3-methyl-1-morpholinobutan-1-one 428

To a solution of ( $R$ )-4-methyl-4-(trichloromethyl)oxetan-2-one 171 ( $0.230 \mathrm{~g}, 1.13$ $\mathrm{mmol})$ in THF ( 2 mL ) was added morpholine $(0.200 \mathrm{~mL}, 2.26 \mathrm{mmol})$ and the solution was heated to $70^{\circ} \mathrm{C}$ for 25 minutes in a microwave reactor. After this time the solution was washed with pH 2 buffer and the combined aqueous fractions were extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo to yield product as a white solid ( $0.304 \mathrm{~g}, 93 \%) . v\left(\mathrm{~cm}^{-1}\right) ; 3191$ (br, O-H stretch), 1601 ( $\mathrm{C}=\mathrm{O}$ stretch), 1115 (C-O stretch), 801 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ $6.50(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.77-3.51\left(8 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.14(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{CHHCO}), 2.78(1 \mathrm{H}, \mathrm{d}$, $J$ 15.5, CHHCO$), 1.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 170.4(\mathrm{CO}), 107.9$ $\left(\mathrm{CCl}_{3}\right), 82.1(\mathrm{C}(\mathrm{OH})), 66.8\left(\mathrm{CH}_{2}\right), 66.6\left(\mathrm{CH}_{2}\right), 46.6\left(\mathrm{CH}_{2}\right), 42.3\left(\mathrm{CH}_{2}\right), 36.0\left(\mathrm{CH}_{2} \mathrm{CO}\right)$, $24.5\left(\mathrm{CH}_{3}\right)$; HRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{9} \mathrm{H}_{14}{ }^{35} \mathrm{Cl}_{3} \mathrm{NNaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+} 311.9931$, found 311.9937; m.p $=120-121^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{20}+30.0\left(c 0.76, \mathrm{CHCl}_{3}\right)$.

## 3-Chloro-2-ethyl-1-morpholinopentane-1,4-dione 434

## 4,5-Diethyl-5-methylfuran-2(5H)-one 435

The compounds were isolated as side products in the following reaction. To a solution of ( $R$ )-4,4,4-trichloro-3-hydroxy-3-methyl-1-morpholinobutan-1-one 428 ( 0.345 g , $1.19 \mathrm{mmol})$ in dry THF ( 5 mL ) was added ethylmagnesium bromide ( $1.19 \mathrm{~mL}, 2 \mathrm{M}$ in THF, 2.38 mmol ) at $0{ }^{\circ} \mathrm{C}$, under nitrogen. The solution was warmed to reflux temperature and stirred for 14 hours. The reaction was quenched with $10 \% \mathrm{AcOH}$ (aq.), extracted with $\mathrm{Et}_{2} \mathrm{O}$ and washed with water and brine. The combined organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. Column chromatography (3:1 petroleum ether/EtOAc) isolated the side product 434 as a single diastereoisomer ( $5 \mathrm{mg}, 1.7 \%$ ) v $\left(\mathrm{cm}^{-1}\right) ; 1725$ (ketone $\mathrm{C}=\mathrm{O}$ stretch), 1628 (amide $\mathrm{C}=\mathrm{O}$ stretch), 1114 (C-O stretch), 777 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 4.65$ $(1 \mathrm{H}, \mathrm{d}, J 10, \mathrm{CHCl}), 3.85-3.78\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.74-3.62\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.57-3.45(1 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{CH}_{2}\right), 3.17\left(1 \mathrm{H}, \mathrm{ddd}, J 11.5,7.5,4, \mathrm{CHCH}_{2}\right), 2.34\left(3 \mathrm{H}, \mathrm{s}, \mathrm{COCH}_{3}\right), 1.90-1.76(2 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.94\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 202.1$ $\left(\mathrm{COCH}_{3}\right), 171.9(\mathrm{CON}), 67.1,66.8\left(\mathrm{CH}_{2}\right), 61.8(\mathrm{CHCl}), 46.8\left(\mathrm{CH}_{2}\right), 44.3\left(\mathrm{CHCH}_{2}\right)$, $42.3\left(\mathrm{CH}_{2}\right), 28.0\left(\mathrm{COCH}_{3}\right), 22.6\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 10.2\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$; HRMS (ESI) m/z: calcd. for $\mathrm{C}_{11} \mathrm{H}_{18}{ }^{35} \mathrm{ClNNaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+}$270.0867, found 270.0868.

Lactone $\mathbf{4 3 5}$ was isolated from the same mixture ( $7 \mathrm{mg}, 3.8 \%$ ) as a colourless oil. Only ${ }^{1} \mathrm{H}$ and ${ }^{13}$ NMR data were obtained for this compound. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ 5.77-5.74 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{COCH}$ ), 2.30-2.12 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{C}_{5}-\mathrm{CH}_{2}$ ), $1.89\left(1 \mathrm{H}\right.$, quin, $J 7.5, \mathrm{C}_{4}-$ $\mathrm{CHH}), 1.65\left(1 \mathrm{H}\right.$, quin, $\left.J 7.5, \mathrm{C}_{4}-\mathrm{CH} H\right), 1.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}_{5}-\mathrm{CH}_{3}\right), 1.23(3 \mathrm{H}, \mathrm{t}, J 7.5$,
$\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.78\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 177.8\left(\mathrm{C}_{3}\right)$, $172.7(\mathrm{CO}), 114.8\left(\mathrm{C}_{2}\right), 89.8\left(\mathrm{C}_{4}\right), 30.3\left(\mathrm{C}_{4}-\mathrm{CH}_{2}\right), 24.0\left(\mathrm{C}_{5}-\mathrm{CH}_{3}\right), 20.5\left(\mathrm{C}_{5}-\mathrm{CH}_{2}\right), 11.1$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 7.5\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$.

## 1-Morpholinobutane-1,3-dione 440

To a solution of ( $R$ )-4,4,4-trichloro-3-hydroxy-3-methyl-1-morpholinobutan-1-one $428(0.349 \mathrm{~g}, 1.21 \mathrm{mmol})$ in THF $(5 \mathrm{~mL})$ was added $\mathrm{KOt}-\mathrm{Bu}(0.136 \mathrm{~g}, 1.21 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$, under nitrogen. The mixture was stirred at room temperature for 16 hours, then the reaction was quenched with MeOH and the solvent was removed in vacuo. The crude residue was purified by column chromatography (100\% EtOAc to 95:5 $\mathrm{EtOAc} / \mathrm{MeOH})$ to yield product as a colourless amorphous solid ( $0.108 \mathrm{~g}, 52 \%$ ). $v$ $\left(\mathrm{cm}^{-1}\right) ; 1717$ (ketone $\mathrm{C}=\mathrm{O}$ stretch), 1630 (amide $\mathrm{C}=\mathrm{O}$ stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500\right.$ $\mathrm{MHz}) \delta$ ketolenol 1:0.18; keto: 3.73-3.61 $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.56\left(2 \mathrm{H}, \mathrm{s}, \mathrm{COCH}_{2}\right), 3.45-$ $3.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.28\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$; enol: $14.6(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 5.10(1 \mathrm{H}, \mathrm{s}, \mathrm{COCH})$, 3.73-3.61 ( $8 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}$ ), $1.96\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta$ keto: 202.4 (CO), $165.1(\mathrm{CO}), 66.9\left(\mathrm{CH}_{2}\right), 66.7\left(\mathrm{CH}_{2}\right), 50.0\left(\mathrm{COCH}_{2}\right), 47.0\left(\mathrm{CH}_{2}\right), 42.3\left(\mathrm{CH}_{2}\right)$, $30.5\left(\mathrm{CH}_{3}\right)$; enol: $175.3(\mathrm{C}(\mathrm{OH})), 171.0(\mathrm{CO}), 86.3(\mathrm{COCH}), 66.9\left(\mathrm{CH}_{2}\right), 66.7\left(\mathrm{CH}_{2}\right)$, $47.0\left(\mathrm{CH}_{2}\right), 42.3\left(\mathrm{CH}_{2}\right), 22.2\left(\mathrm{CH}_{3}\right)$; LRMS (ESI) m/z: calcd. for $\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{NaNO}_{3}$ $[\mathrm{M}+\mathrm{Na}]^{+}$194.1, found 194.1. Spectroscopic data are consistent with that previously reported. ${ }^{443}$

## Benzyl-(R)-2-(4,4,4-trichloro-3-hydroxy-3-methylbutanoyl)hydrazine-1-

## carboxylate 444

To a solution of ( $R$ )-4-methyl-4-(trichloromethyl)oxetan-2-one 171 ( $0.398 \mathrm{~g}, 1.96$ mmol ) in THF ( 5 mL ) was added benzyl hydrazinecarboxylate ( $0.440 \mathrm{~g}, 2.70 \mathrm{mmol}$ ) 443 and the solution was heated to $60{ }^{\circ} \mathrm{C}$ for 72 hours. After cooling to room temperature, the mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}$ and the organic layer was washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ (aq.) and pH 2 buffer. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude residue was purified by column chromatography (6:4 petroleum ether/EtOAc) to yield product as a white solid (657 $\mathrm{mg}, 92 \%) . v\left(\mathrm{~cm}^{-1}\right) ; 3341$ (br, O-H stretch), 1730 (C=O stretch), 1678 (C=O stretch), 1216 and 1038 (C-O stretch), 729 and 692 (Ar-H bend); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 9.81(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 9.26(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 7.42-7.29(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 6.40(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 5.09$ $\left(1 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 2.76(1 \mathrm{H}, \mathrm{d}, J 13, \mathrm{CHHCO}), 2.65(1 \mathrm{H}, \mathrm{d}, J 13, \mathrm{CHHCO}), 1.63(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 168.5\left(\mathrm{COCH}_{2}\right), 156.0\left(\mathrm{CO}_{2}\right), 136.6(\mathrm{Ph}-\mathrm{C})$, 128.4 (Ph-C), 128.0 ( $\mathrm{Ph}-\mathrm{C}), 127.9$ (Ph-C), $109.6\left(\mathrm{CCl}_{3}\right), 81.2(\mathrm{C}(\mathrm{OH})), 65.9\left(\mathrm{OCH}_{2}\right)$, $40.2\left(\mathrm{CH}_{2}\right)$, $21.5\left(\mathrm{CH}_{3}\right)$; HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{13} \mathrm{H}_{15}{ }^{35} \mathrm{Cl}_{3} \mathrm{~N}_{2} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+}$ 390.9990, found $390.9993 ;$ m.p $=147-148^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{20}-30.0\left(c 0.03, \mathrm{CHCl}_{3}\right)$.

## Compound 445 or 446

To a solution of benzyl (R)-2-(4,4,4-trichloro-3-hydroxy-3-methylbutanoyl)hydrazine-1-carboxylate $444(0.270 \mathrm{~g}, 0.738 \mathrm{mmol})$ in THF ( 4 mL ) was added 2 M NaOH (aq.) ( $1.48 \mathrm{~mL}, 2.95 \mathrm{mmol}$ ) under nitrogen, and the solution was stirred at room temperature overnight. The solvent was removed in vacuo and the residue dissolved in EtOAc. This solution was acidified to pH 2, washed three times with pH 2 buffer and the organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to give the product as a colourless oil (0.100 g, 49\%). This compound was difficult to purify so it was used directly in the next step as a crude mixture.

448 or 449 ( $\mathrm{X}=\mathrm{Cl}$ )

449

To a solution of crude unknown cyclic acid 445 or 446 ( $0.220 \mathrm{~g}, 0.791 \mathrm{mmol}$ ) from the previous step in dry THF ( 5 mL ) was added EDCI.HCl ( $0.303 \mathrm{~g}, 1.58 \mathrm{mmol}$ ), DMAP ( $0.193 \mathrm{~g}, 1.58 \mathrm{mmol}$ ) and $p$-chlorobenzylamine ( $0.190 \mathrm{~mL}, 1.58 \mathrm{mmol}$ ) and stirred at room temperature under nitrogen overnight. The mixture was then
partitioned between EtOAc and pH 2 buffer and the organic layer was washed with pH 2 buffer three times. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude product was purified by column chromatography (9:1 to $8: 2$ to $1: 1$ petroleum ether/EtOAc) to yield product as a colourless oil ( 70 mg , $28 \%) . v\left(\mathrm{~cm}^{-1}\right) ; 3263$ (br, N-H stretch), 1787 (C=O stretch), 1718 (C=O stretch), 1649 ( $\mathrm{C}=\mathrm{O}$ stretch), 1244 and 1041 (C-O stretch), 733 ( $\mathrm{C}-\mathrm{Cl}$ stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500\right.$ $\mathrm{MHz}) \delta 9.04(1 \mathrm{H}, \mathrm{s}, \mathrm{NHN}), 7.81\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{NH}\right), 7.43-7.09(9 \mathrm{H}, \mathrm{m}, \mathrm{Ar}-\mathrm{H}), 5.15(1 \mathrm{H}$, d, J 12, CHHO), $5.05(1 \mathrm{H}, \mathrm{d}, J 11.5, \mathrm{CHHO}), 4.45-4.31\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{NH}\right), 3.00(1 \mathrm{H}$, d, $J 15, \mathrm{C} H \mathrm{HCO}), 2.77(1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{CH} H \mathrm{CO}), 1.61\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 171.1(\mathrm{CONH}), 168.3\left(\mathrm{CH}_{2} \mathrm{CO}\right), 157.1(\mathrm{OCONH}), 136.6,134.7,133.3$, 129.3, 129.0, 128.9, 128.8, 128.5 (Ar-C), $68.9\left(\mathrm{CH}_{2} \mathrm{O}\right), 65.6\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right), 47.8\left(\mathrm{CH}_{2} \mathrm{CO}\right)$, $42.9\left(\mathrm{CH}_{2} \mathrm{NH}\right)$, $13.7\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$; HRMS (ESI) m/z: calcd. for $\mathrm{C}_{20} \mathrm{H}_{20}{ }^{35} \mathrm{ClN}_{3} \mathrm{NaO}_{4}$ $[\mathrm{M}+\mathrm{Na}]^{+} 424.1035$, found 424.1037; $[\alpha]_{\mathrm{D}}{ }^{20}-115\left(c 0.45, \mathrm{CHCl}_{3}\right)$.

## 448 or 449 ( $\mathrm{X}=\mathrm{Br}$ )

To a solution of crude unknown cyclic acid 445 or $446(0.115 \mathrm{~g}, 0.414 \mathrm{mmol})$ from the previous step in dry THF ( 3 mL ) was added EDCI. $\mathrm{HCl}(0.159 \mathrm{~g}, 0.828 \mathrm{mmol})$, DMAP ( $0.101 \mathrm{~g}, 0.828 \mathrm{mmol}$ ) and $p$-bromobenzylamine ( $0.100 \mathrm{~mL}, 0.828 \mathrm{mmol}$ ) and stirred at room temperature under nitrogen overnight. The mixture was then partitioned between EtOAc and pH 2 buffer and the organic layer was washed with
pH 2 buffer three times. The organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude product was purified by column chromatography (4:6 to 3:7 petroleum ether/EtOAc) to yield the product as a colourless oil ( 24 mg , $13 \%) . v\left(\mathrm{~cm}^{-1}\right) ; 3265$ (br, N-H stretch), 1789 (C=O stretch), 1720 (C=O stretch), 1653 ( $\mathrm{C}=\mathrm{O}$ stretch), 1248 and 1043 (C-O stretch), 748 (C-Br stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$ $\mathrm{MHz}) \delta 9.00(1 \mathrm{H}, \mathrm{s}, \mathrm{NHN}), 7.47-7.27(9 \mathrm{H}, \mathrm{m}, \mathrm{Ar}-\mathrm{H}), 7.15\left(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{CH}_{2} \mathrm{NH}\right)$, $5.15(1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CHHO}), 5.06(1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CHHO}), 4.43-4.31\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{NH}\right)$, $3.01(1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{C} H \mathrm{HCO}), 2.79(1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{CH} H \mathrm{CO}), 1.62\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 170.9(\mathrm{CONH}), 168.0\left(\mathrm{CH}_{2} \mathrm{CO}\right), 156.9(\mathrm{OCONH}), 137.1,134.5$, 131.7, 129.6, 128.9, 128.8, 128.5, 121.3 (Ar-C), $68.9\left(\mathrm{CH}_{2} \mathrm{O}\right), 65.5\left(C\left(\mathrm{CH}_{3}\right)\right), 47.8$ $\left(\mathrm{CH}_{2} \mathrm{CO}\right), 42.9\left(\mathrm{CH}_{2} \mathrm{NH}\right), 18.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$; HRMS (ESI) m/z: calcd. for $\mathrm{C}_{20} \mathrm{H}_{20}{ }^{79} \mathrm{BrN}_{3} \mathrm{NaO}_{4}[\mathrm{M}+\mathrm{Na}]^{+} 468.0529$, found 468.0525; $[\alpha]_{\mathrm{D}}{ }^{20}-101\left(c 0.42, \mathrm{CHCl}_{3}\right)$. 448 or $449\left(X=\mathrm{NO}_{2}\right)$

To a solution of crude unknown cyclic acid 445 or $446(0.150 \mathrm{~g}, 0.540 \mathrm{mmol})$ from the previous step in dry THF ( 3 mL ) was added EDCI. $\mathrm{HCl}(0.207 \mathrm{~g}, 1.08 \mathrm{mmol})$, DMAP ( $0.132 \mathrm{~g}, 1.08 \mathrm{mmol}$ ), p-nitrobenzylamine hydrochloride $(0.203 \mathrm{~g}, 1.08$ $\mathrm{mmol})$, trimethylamine $(0.300 \mathrm{~mL}, 2.16 \mathrm{mmol})$ and stirred at room temperature under nitrogen overnight. The mixture was then partitioned between EtOAc and pH 2 buffer and the organic layer was washed with pH 2 buffer three times. The organic fractions
were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude product was purified by column chromatography ( $100 \% \mathrm{EtOAc}$ ) to yield product as a colourless oil ( $38 \mathrm{mg}, 17 \%$ ). v ( $\mathrm{cm}^{-1}$ ); 3260 (br, N-H stretch), 1784 ( $\mathrm{C}=\mathrm{O}$ stretch), 1715 ( $\mathrm{C}=\mathrm{O}$ stretch), 1651 ( $\mathrm{C}=\mathrm{O}$ stretch), 1249 and 1040 (C-O stretch), ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 9.20(1 \mathrm{H}, \mathrm{s}, \mathrm{NHN}), 8.21-8.19(2 \mathrm{H}, \mathrm{m}, \mathrm{Ar}-\mathrm{H}), 7.46-7.28(7 \mathrm{H}, \mathrm{m}$, Ar-H), 7.07 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{NH}$ ), 5.19 ( $1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CHHO}$ ), 5.13 ( $1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CHHO}$ ), 4.59-4.45 (2H, m, CH2NH), 3.06 ( $1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{CHHCO}$ ), 2.86 ( $1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{CHHCO}$ ), $1.66\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 171.1(\mathrm{CONH}), 167.7\left(\mathrm{CH}_{2} \mathrm{CO}\right)$, 157.0 (OCONH), 147.3, 145.5, 134.4, 129.0, 128.8, 128.44, 128.41, 123.9 (Ar-C), $69.1\left(\mathrm{CH}_{2} \mathrm{O}\right), 65.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$, $48.1\left(\mathrm{CH}_{2} \mathrm{CO}\right), 42.9\left(\mathrm{CH}_{2} \mathrm{NH}\right), 18.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$; HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{~N}_{4} \mathrm{NaO}_{6}[\mathrm{M}+\mathrm{Na}]^{+} 435.1275$, found 435.1274; $[\alpha]_{\mathrm{D}}{ }^{20}-97.7$ (c 0.26, $\mathrm{CHCl}_{3}$ ).

## (R)-N,N-Dibenzyl-4,4,4-trichloro-3-hydroxy-3-methylbutanamide 453

To a solution of (R)-4-methyl-4-(trichloromethyl)oxetan-2-one 171 ( $0.243 \mathrm{~g}, 1.20$ mmol ) in THF ( 5 mL ) was added dibenzylamine ( $0.460 \mathrm{~mL}, 2.40 \mathrm{mmol}$ ), and the solution was stirred at $60^{\circ} \mathrm{C}$ for 88 hours. The solvent was removed in vacuo and the residue was passed through a short plug of silica eluting with $85: 15$ petroleum ether/EtOAc, to yield product as a white solid ( $0.337 \mathrm{~g}, 64 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3272$ (br, OH stretch), 1624 (C=O stretch), 1216 (C-O stretch), 758 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.64-7.46(8 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 7.41-7.36(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 5.09(1 \mathrm{H}, \mathrm{d}$, $J$ 14.5, CHHN), $4.79(1 \mathrm{H}, \mathrm{d}, J 17, \mathrm{C} H \mathrm{HN}), 4.70(1 \mathrm{H}, \mathrm{d}, J 14.5, \mathrm{CH} H \mathrm{~N}), 4.67(1 \mathrm{H}, \mathrm{d}$, $J$ 17, CHHN), $3.98(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{CHHC}(\mathrm{OH})), 3.09(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{CHHC}(\mathrm{OH}))$,
$1.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 172.9(\mathrm{CO}), 136.4,135.8,129.3$, 129.0, 128.7, 128.2, 128.0, 126.5 (Ar-C), $107.7\left(\mathrm{CCl}_{3}\right), 82.1(\mathrm{C}(\mathrm{OH})), 50.6,49.1$ $\left(\mathrm{CH}_{2} \mathrm{~N}\right), 36.4\left(\mathrm{CH}_{2} \mathrm{CO}\right), 24.6\left(\mathrm{CH}_{3}\right)$; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd. for $\mathrm{C}_{19} \mathrm{H}_{21}{ }^{35} \mathrm{Cl}_{3} \mathrm{NO}_{2}$ $[\mathrm{M}+\mathrm{H}]^{+} 400.0632$, found $400.0632 ; \mathrm{m} . \mathrm{p}=113-114^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}-14.7\left(c 0.38, \mathrm{CHCl}_{3}\right)$.

## Chapter 3

Given our success using ( $R$ )-4-methyl-4-(trichloromethyl)oxetan-2-one (171) in the synthesis of both $\alpha$ - and $\gamma$-tocopherol, we decided to explore further transformations of this somewhat underused chiral building block. The only other reports in the literature using this lactone in synthesis were discussed previously in section 2.1.

## 3.1 (R)-4-(Trichloromethyl)-oxetanone 254a

There are more reports in the literature detailing the use of lactone $\mathbf{2 5 4 a}$ as an enantiomerically enriched starting material. Song et al. used lactone 254a in the synthesis of ester 455, a key intermediate in the synthesis of $(R)$-carnitine (Scheme 145). ${ }^{444}$

(R)-carnitine

Scheme 145. Reagents and conditions: $\mathrm{TsOH}\left(2.0 \mathrm{~mol} \%\right.$ ), EtOH , reflux, $25 \mathrm{~h} ; n-\mathrm{Bu}_{3} \mathrm{SnH}$ (2.1 equiv.), THF, reflux, 28 h .

The ethanolysis of 254a had previously been reported by Wynberg and Staring ${ }^{445}$ and no racemisation is observed during the reaction. Selective bis-dechlorination was strongly dependent on the temperature - at room temperature the sole product was the singly dechlorinated compound. Conversion of ester $\mathbf{4 5 5}$ into $(R)$-carnitine had been previously reported. ${ }^{446}$

In addition to their work on the Fridel-Crafts ring opening of 254a, Fujisawa et al. also demonstrated that the lactone could be readily opened by ester enolates (Scheme 146). ${ }^{357}$

Scheme 146. Reagents and conditions: $\mathbf{4 5 6}$ (5.0 equiv.), THF, $-78^{\circ} \mathrm{C}, 3 \mathrm{~h}$; $\mathrm{Et}_{3} \mathrm{~B}$ (1.1 equiv.), $\mathrm{NaBH}_{4}$ (1.1 equiv.), $-100{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}$; TFA ( 100 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 12 \mathrm{~h} ; 0.1 \mathrm{M} \mathrm{HCl}$ (cat.), $4 \AA$ molecular sieves, $50^{\circ} \mathrm{C}, 24 \mathrm{~h}$.

The enolate adduct 457 was elaborated into the $\beta$-hydroxy- $\gamma$-valerolactone 460, a useful precursor to Compactin 461 and Mevinolin 462. Schulz et al. used similar methodology in their synthesis of Sigillin A 463. ${ }^{477}$

Romo and Liu used ( $R$ )-lactone 254a as part of a synthesis of Schulzeine B (Scheme 147). The tetrahydroisoquinoline 466 was obtained as a separable mixture of diastereoisomers from the Pictet-Spengler reaction ${ }^{448}$ of 465 and eventually subjected to modified Corey-Link conditions to yield the $\delta$-lactam 467 .

Scheme 147. Synthesis of Schulzeine B.

### 3.2 The Synthesis of (R)-dihydroditronellol

We were most interested in reports that lactone $\mathbf{2 5 4 a}$ could be directly reduced using $\mathrm{LiAlH}_{4}$ (Wynberg et al.) ${ }^{445}$ or using DIBAL-H (Fujisawa et al.), ${ }^{358}$ to yield the diol 322 (Scheme 148).

Scheme 148. Direct reduction of lactone 254a.

Both Wynberg and Fujisawa reported that the high enantiomeric excess of 254a was unchanged by the reduction.

During the course of this research, Snowden et al. published the one-carbon homologation of aldehydes 470, using a Jocic reaction with a hydride nucleophile (Scheme 149). ${ }^{350}$

Scheme 149. One-carbon homologation of trichlorocarbinols. Reagents and conditions: $\mathrm{LiBH}_{4}$ (4.0 equiv.), NaOH (3.0 equiv.), IPA, $40^{\circ} \mathrm{C}, 16-24 \mathrm{~h}$.

Given that the authors only used secondary trichloroalcohol substrates they could not study the stereochemical outcome of the reaction. We imagined that lactone $\mathbf{1 7 1}$ could be reduced in the same way as lactone 254a, to yield an enantiomerically enriched, tertiary trichlorocarbinol 473 (Scheme 150).

Scheme 150. Proposed reduction of lactone 171.

It was expected that the diol $\mathbf{4 7 3}$ would undergo the same Jocic reaction when subjected to the conditions described by Snowden et al. to yield an isoprenoid compound, potentially in high enantiomeric excess. Table 32 shows a brief optimisation study for the direct reduction of lactone 171.

| entry | reductant | solvent | temperature $\left({ }^{\circ} \mathbf{C}\right)$ | time (h) | yield (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | $\mathrm{LiAlH}_{4}$ | THF | 0 | 1 | 85 |
| $\mathbf{2}$ | DIBAL-H | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | 23 | 16 | 55 |
| $\mathbf{3}$ | $\mathrm{NaBH}_{4}$ | MeOH | 23 | 16 | 0 |
| $\mathbf{4}$ | $\mathrm{LiBH}_{4}$ | THF | 0 | 1 | 67 |
| $\mathbf{5}$ | $\mathrm{LiBH}_{4}$ | THF | 0 | 0.5 | 99 |

Table 32. Optimisation of conditions for the reduction of lactone 171. 3.0 Equivalents of the reductant were used in each entry.

Using $\mathrm{LiAlH}_{4}$ as described by Wynberg (entry 1) gave the diol 473 in good yield. However, unidentified side products were present in the crude mixture so the compound required purification by column chromatography. We imagined that there should be conditions that would yield diol $\mathbf{4 7 3}$ without the need for extra purification, so alternative reductants were screened. The use of DIBAL-H (entry 2) gave a less satisfactory yield of the diol. The reaction with $\mathrm{NaBH}_{4}$ yielded unreacted starting materials only. $\mathrm{LiBH}_{4}$ yielded diol 473 after 30 minutes at $0{ }^{\circ} \mathrm{C}$, in essentially quantitative yield without the need for further purification (entry $\mathbf{5}$ ). Gram-quantities of the diol were accessible using this procedure.

With the diol 473 in hand, we first wondered if it would undergo a Jocic reaction/lactonisation like that reported by Romo et al. (Scheme 151). ${ }^{354}$

Scheme 151. Attempted synthesis of $\alpha$-disubstituted $\gamma$-lactones.
p-Methoxyphenol was chosen as the nucleophile, since it had been previously reported by Corey to take part in Jocic reactions of the type in scheme 151. ${ }^{435}$ Unfortunately, under the conditions described by Romo et al. an unidentifiable mixture was obtained.

In order to prevent side reactions in the homologation reaction of 473, the primary alcohol was selectively protected with triisopropylsilyl chloride. This group is known to be stable to alkaline conditions. ${ }^{49}$ The monoprotected diol $\mathbf{4 7 4}$ was then subjected to the conditions developed by Snowden et al. (Scheme 152).

Scheme 152. One-carbon homologation of a tertiary trichlorocarbinol.

The desired alcohol $(R)-\mathbf{4 7 5}$ was isolated in $64 \%$ yield under the conditions described by Snowden. However, also present in the crude reaction mixture was the secondary alcohol 476. It was not possible to establish the ratio of $\mathbf{4 7 5 : 4 7 6}$ from the crude ${ }^{1} \mathrm{H}$ NMR spectrum since the peaks were overlapping (Figure 19). The formation of 476 can be rationalised using the following mechanistic pathway (Scheme 153).

Figure 19. ${ }^{1} \mathrm{H}$ NMR of crude reaction mixture. Inset: magnified region showing $\alpha-\mathrm{CH}$ protons.

479

476

478
$\downarrow \mathrm{LiBH}_{4}$

(R)-475

Scheme 153. Reaction pathways leading to the formation of alcohols $(R)-\mathbf{4 7 5}$ and $\mathbf{4 7 6}$.

The predominant pathway must be path a, following the accepted Jocic reaction mechanism to yield the primary alcohol 475. The formation of secondary alcohol 476 is presumably due to initial elimination of $\mathrm{CHCl}_{3}$ from the trichlorocarbinol $(R)-\mathbf{4 7 3}$ to give ketone 479, which is reduced by $\mathrm{LiBH}_{4}$. Snowden et al. reported no such side
products, since there will not be as great a driving force for elimination of $\mathrm{CHCl}_{3}$ in the corresponding secondary trichlorocarbinols.

Luckily, the primary alcohol $(R)$ - $\mathbf{4 7 5}$ was separable from the side product alcohol 476 by column chromatography. In order to measure the e.e. of the primary alcohol we first attempted to use the ( $R$ )- and ( $S$ )-Mosher's ester derivatives. Unfortunately, the diastereomeric esters showed no difference by ${ }^{1} \mathrm{H}$ NMR spectroscopy. We therefore turned to HPLC analysis. Scheme 154 describes the racemic synthesis of ( $\pm$ )-475. An aldol condensation between ethyl acetate enolate and 1,1,1-trichloroacetone 480 yielded the adduct 481 in moderate yield. The use of $\mathrm{LiAlH}_{4}$ in place of $\mathrm{LiBH}_{4}$ in the following reduction gave a poor yield (34\%) of the diol ( $\pm$ )-473. Monoprotection of the diol with triisopropylsilyl chloride was carried out in the same manner as for the enantiomerically enriched compound.

Scheme 154. Synthesis of racemic monoprotected diol ( $\pm$ )-475.

The reaction of trichlorocarbinol $( \pm)-474$ with $\mathrm{NaOH} / \mathrm{LiBH}_{4}$ yielded the alcohol ( $\pm$ )475 in comparable yield, along with 476 which was separated by column chromatography. Both the racemate and the enantiomerically enriched alcohols 475 were then converted into the diphenylphosphinate esters $(R)-482$ and ( $\pm$ )-482 (Scheme 155).

Scheme 155. Synthesis of phosphonate esters.

Benzoate esters are commonly used for the HPLC analysis of compounds with no chromophore, however other members of the group have had success in separating enantiomers using the phosphonate ester group.

Figure 20. HPLC trace of ( $\pm$ )-482.

Figure 21. HPLC trace of ( $R$ )-482. Conditions: Daicel Chiralcel AD-H column, 2-propanol : hexane $=98: 2,1 \mathrm{~mL} / \mathrm{min}, 225 \mathrm{~nm},(S)$ isomer $32.49 \mathrm{~min},(R)$-isomer 36.84 min .

The e.e. of phosphonate ester (R)-482 was measured to be $92 \%$ (Figures 20 and 21), and the absolute configuration of the alcohol 475 was established as $(R)$ by comparison of the measured optical rotation to the literature value. This corresponds to an expected
inversion of configuration during the Jocic reaction. Given that the ring-opening of the gem-dichloroepoxide 477 is known to be highly stereospecific, the racemisation must be taking elsewhere in the reaction mechanism. Snowden et al. reported that isopropyl esters such as $\mathbf{4 8 3}$ were intermediates in the reaction pathway (Scheme 156).

Scheme 156. Formation of an isopropyl ester intermediate 483.

This intermediate was also identified during our work. Both the acid chloride 478 and the ester 483 will be prone to enolisation under the alkaline conditions due to the $\alpha$ protons in each compound, so it seems likely that this is the source of the racemisation taking place in the reaction.

A search in the literature revealed alcohol (S)-484 to be a key intermediate in a stereoselective synthesis of $(3 R, 7 R)$-hexahydrofarnesol 32 by Matsueda et al. (Scheme 157). ${ }^{450}$ We envisaged that the same sequence of reactions using $(S)$ - rather than $(R)$ 475 should yield $(R)$-dihydrocitronellol 487, and eventually $(3 R, 7 R)$ hexahydrofarnesol 32. We decided to keep triisopropylsilane as the protecting group since we imagined that it should not behave differently to tert-butyldimethylsilane (TBDMS) under the reaction conditions shown in scheme 157.

Scheme 157. Synthesis of ( $3 R, 7 R$ )-hexahydrofarnesol 32 by Matsueda et al. Reagents and conditions: $\mathrm{I}_{2}$ (1.3 equiv.), $\mathrm{PPh}_{3}$ (1.2 equiv.), imidazole (1.3 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 16 \mathrm{~h} ; 486$ (2.0 equiv.), $\mathrm{CuCl}_{2}$ (3.0 mol\%), 1-phenyl-1-propyne ( 0.15 equiv.), THF, rt, 2 h ; TBAF ( 2.0 equiv.), THF, rt, 3 h .

Scheme 158 shows the synthesis of $(R)$-dihydrocitronellol 487. The same sequence of reactions previously developed were used to synthesise ( $S$ )-alcohol 475, starting from the $(S)$-enantiomer of lactone 171 . The conversion of $(S)-475$ into $(R)$ dihydrocitronellol 487 was then carried out according to Matsueda et al.

Scheme 158. Synthesis of ( $R$ )-dihydrocitronellol 487.

It was imagined that the racemisation observed during the Jocic reaction to form alcohol (S)-475 might be suppressed by lowering the reaction temperature. Accordingly, when the reaction was carried out at $0-2{ }^{\circ} \mathrm{C}$ no racemisation was observed by chiral HPLC (Figure 23). However, the reaction was extremely sluggish and only went to $25 \%$ conversion after four days. The reaction was similarly slow at
$10{ }^{\circ} \mathrm{C}$. When the reaction was carried out at room temperature the e.e. appears to increase and none of the ( $R$ )-enantiomer could be observed (Figure 24). An increased reaction time ( 24 hours) was required to ensure full conversion. An attempt was made to convert ( $\pm$ )-dihydrocitronellol 487 into its phosphonate ester for a direct measurement of the stereochemical purity of the ( $R$ )-dihydrocitronellol 487 product, but the enantiomers were inseparable by chiral HPLC.

Scheme 159. Synthesis of phosphonate ester ( $S$ )-482.

Figure 22. HPLC trace of the phosphonate ester ( $\pm$ )-482.

Figure 23. HPLC trace of the phosphonate ester $(S)-\mathbf{4 8 2}\left(0^{\circ} \mathrm{C}\right.$ reaction temperature).

Figure 24. HPLC trace of the phosphonate ester ( $S$ )-482 (room temperature reaction). Conditions:
Daicel Chiracel AD-H column, 2-propanol : hexane $98: 2,1 \mathrm{~mL} / \mathrm{min}, 225 \mathrm{~nm},(S)$ isomer 33.78 min , $(R)$ isomer 38.80 min .

Using this successive Grignard coupling strategy, all four stereoisomers of hexahydrofarnesol ought to be accessible in high e.e. and d.e. (Scheme 160). This strategy was previously used by Barner et al. where the source of chirality was a natural $\gamma$-lactone. ${ }^{168,170}$

Scheme 160. Potential stereoselective synthesis of all four stereoisomers of hexahydrofarnesol.

In this way, $(R)$-dihydrocitronellol 487 was converted into ( $3 R, 7 R$ )-hexahydrofarnesol 32 (Scheme 161). Unfortunately, the second Grignard coupling step was low yielding and the desired hexahydrofarnesol 32 was contaminated with inseparable side products. Further attempts, preferably on a larger scale, would be required to optimise this step. Nevertheless, this work further demonstrates the usefulness of trichlorolactones such as $\mathbf{1 7 1}$ as chiral building blocks.

Scheme 161. Completion of the hexahydrofarnesol synthesis.

### 3.3 Scope of the Reductive Jocic Reaction

We established that the Jocic reaction with a hydride nucleophile developed by Snowden et al. produced alcohols in high e.e. when enantiomerically pure, tertiary trichlorocarbinols were used as substrates. We were therefore interested to explore the potential generality of the homologation reaction.

### 3.3.1 The Synthesis of Tertiary Tridhlorocarbinols

Whilst the synthesis of secondary trichlorocarbinols from aldehydes is well established, ${ }^{235-237,261}$ the synthesis of tertiary trichlorocarbinols from ketones is more difficult. This is primarily due to competing enolisation when strong bases are used. Li et al. reported the use of organotitanium reagents to prepare tertiary trichlorocarbinols, and high yields were obtained from readily enolisable ketones (Scheme 162). ${ }^{238}$

Scheme 162. Reagents and conditions: $\mathrm{CHCl}_{3}$ (5.0 equiv.), $n-\mathrm{BuLi}$ (5.0 equiv.), $\mathrm{TiCl}\left(\mathrm{O}^{i} \operatorname{Pr}\right)_{3}$ (2.0 equiv.), THF, $-60^{\circ} \mathrm{C}, 4 \mathrm{~h} . \mathrm{R}^{1}=$ aryl, vinyl; $\mathrm{R}^{2}=$ alkyl.

This seemed to be a potential general procedure. Unfortunately, in this project when the simple ketones 494 and 496 were subjected to the reported conditions the reaction either failed or was low yielding (Scheme 163). Alternative procedures were therefore sought.

Scheme 163. Attempted synthesis of tertiary trichlorocarbinols.

Henegar and Lira developed a protocol for in situ generation of $\mathrm{TMS}^{-} \mathrm{CCl}_{3}$ and addition to carbonyl compounds (Scheme 164). ${ }^{256,379}$

Scheme 164. Synthesis of trichlorocarbinols using in situ generated TMS-CCl $3 . \mathrm{R}^{1}=\operatorname{aryl}$, alkyl; $\mathrm{R}^{2}=$ H, alkyl.

In addition, they showed that using the bulky $\mathrm{TMS}-\mathrm{CCl}_{3}$ nucleophile gave good diastereoselectivity for substituted cyclohexanone substrates (Scheme 165).

Scheme 165. Diastereoselective synthesis of trichlorocarbinol 503.

As expected, the $\mathrm{CCl}_{3}$ group preferentially added anti to the 2-phenyl substituent. Because a variety of substituted cyclohexanone compounds are commercially available, we imagined this method might provide a route to diastereomerically enriched trichlorocarbinols such as 503, as well as general racemic compounds, in order to establish the scope of the Jocic reaction.

The use of identical conditions to those shown in schemes 164 and 165 failed to give any trace of product when $\mathbf{4 9 6}$ was used as the ketone; however, addition of LiHMDS to a solution of ketone $\mathbf{4 9 6}$ and $\mathrm{CHCl}_{3}$ in THF yielded the desired trichlorocarbinol 497 in an acceptable yield of $63 \%$ (Scheme 166).

Scheme 166. Synthesis of tertiary trichlorocarbinol 497.

In this way a variety of alkyl trichlorocarbinols were synthesised (Figure 25). Aryl ketones were not considered suitable substrates at this point due to their low yielding conversion into trichlorocarbinols by this method. The yields for compounds 505a-i ranged from moderate to good. The method of Aggarwal ${ }^{236}$ used for compound $\mathbf{5 0 5 f}$ failed when applied to any other substrate.

505a $63 \%$

505h 53\%

505i 67\%

Figure 25. Synthesis of tertiary trichlorocarbinols. ${ }^{\text {a }}$ This compound was synthesised using the method of Aggarwal et al.: $\mathrm{CHCl}_{3}$ ( 2.0 equiv.), DBU (1.0 equiv.), rt, 16 h .

### 3.3.2 Jocic Reation using Hydride Nudeophile

With the trichlorocarbinols 505a-i in hand, we subjected them to the reductive Jocic reaction conditions we had previously developed. The results are shown in Table 33. Unfortunately, most of the substrates were inseparable from the secondary alcohol $\mathbf{5 0 7}$ side product. The low crude yield of $\mathbf{5 0 6} \mathbf{a}$ is likely due to the volatility of the low molecular weight alcohol. None of the linear alkyl substrates (a-e) tested could be separated from the secondary alcohol side product. The increased steric hindrance of 505e is presumably responsible for the higher proportion of side product, due to a greater driving force for elimination of $\mathrm{CHCl}_{3}$. Smaller rings (cyclopentyl, $\mathbf{5 0 5 f}$ and cyclohexyl, 505g) gave more favourable ratios than the larger rings (cyclooctanyl, $\mathbf{5 0 5 h}$ and cyclododecanyl, 505i). However, it was possible to isolate the primary alcohol 506i cleanly in $49 \%$ yield.

Table 33. Reagents and conditions: $\mathrm{LiBH}_{4}$ (4.0 equiv.), NaOH (3.0 equiv.), IPA, rt, 24 h .
${ }^{\text {a }}$ Determined by analysis of the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude material. ${ }^{\text {b }}$ Crude yield: compound $\mathbf{5 0 6}$ was inseparable from compound 507. ${ }^{\text {c }}$ Crude yield: compound was difficult to isolate due to its volatility.

Figure 26. Top: ${ }^{1} \mathrm{H}$ NMR spectrum of entry a crude mixture. Bottom: ${ }^{1} \mathrm{H}$ NMR spectrum of entry $\mathbf{h}$ crude mixture.

### 3.4 Didhlorocarbinols as Altemative Substrates

We established that hydride could take part in a Jocic reaction with tertiary trichlorocarbinols to yield various branched alcohols, in an overall one-carbon homologation from the starting material ketone. However, the main drawback appeared to be the formation of a secondary alcohol which was often inseparable from the desired primary alcohol. The ratio of the two products was also found to be in favour of the secondary alcohol for the more hindered substrates. We imagined that using the corresponding dichlorocarbinols might provide a solution to this issue, since the elimination of dichloromethane from the compound will be much less favourable and therefore slower than the elimination of chloroform.

### 3.4.1 Literature Syntheses and Reactions of Didhlorocarbinols

Methods for the synthesis of tertiary dichlorocarbinols in the literature are scarce. Ohshiro et al. used diethyl phosphonate-triethylamine to reduce trichlorocarbinol $\mathbf{5 0 8}$ to the corresponding dichlorocarbinol 509 (Scheme 167). ${ }^{451}$

Scheme 167. Reagents and conditions: diethyl phosphonate (4.0 equiv.), $\mathrm{NEt}_{3}$ ( 3.0 equiv.), $80^{\circ} \mathrm{C}$, 12 h.

The trichloromethyl group can also be electrochemically reduced selectively to the dichloromethyl group (Scheme 168). ${ }^{452}$

Scheme 168. Electrochemical reduction of trichloromethyl group. Mercury cathode, -1.6 V working potential versus saturated calomel electrode.

Fechtel et al. synthesised 511 in this way and used it in a Jocic-type reaction, with a phenoxide nucleophile (Scheme 169). ${ }^{336}$

Scheme 169. Synthesis of $\alpha$-aryloxy-aldehydes.

Although this reaction was carried out on a secondary substrate, and we were interested in tertiary substrates, we still felt it was promising for our proposal. Additionally, the authors managed to isolate the chloroepoxide 512, which provides further evidence for these epoxides as intermediates in the general Jocic reaction mechanism.

Probably the most straightforward method for the synthesis of dichlorocarbinols is the addition of dichloromethyl anion, much like the procedures discussed in Chapter 1 for the synthesis of trichlorocarbinols. Taguchi et al. described a practical synthesis of polyhalomethyl-lithium adducts (Scheme 170). ${ }^{433,454}$

Scheme 170. Reagents and conditions: Lithium dicyclohexylamide ( 2.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$.

The lesser acidity of dichloromethane compared to chloroform requires that a stronger base than LiHMDS be used. Lithium dicyclohexylamide, lithium diisopropylamide and lithium 2,2,6,6-tetramethylpiperidine all gave similar results. The steric bulk of these bases and the low temperature used helps to minimise enolisation side reactions. In addition to dichloromethane, the authors found that dibromomethane, diiodomethane and bromoform all gave the adducts in useful yields.

Deloisy et al. used this procedure to synthesise a sugar-derived dichlorocarbinol in stereoselective fashion, which then underwent a Jocic reaction with sodium azide (Scheme 171). ${ }^{455}$

Scheme 171. Stereoselective synthesis of $\alpha$-azido aldehyde 520a and 520b. Reagents and conditions:
LDA (4.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (4.0 equiv.), THF, $-78^{\circ} \mathrm{C}$ to rt; $\mathrm{NaN}_{3}$ ( 10 equiv.), DMPU ( 5.0 equiv.), 15-crown-5 (0.1 equiv.), $70^{\circ} \mathrm{C}$. DMPU = 1,3-Dimethyl-3,4,5,6-tetrahydro-2(1H)-pyrimidinone.

The addition of dichloromethyllithium to the ketone 518a took place selectively to yield dichlorocarbinol 519a, which in turn was converted into the $\alpha$-azido aldehyde 520a by treatment with sodium azide. The same reaction sequence with $\mathrm{R}=\mathrm{Bn}$ yielded $\mathbf{5 2 0 b}$ as a 2:1 mixture of diastereoisomers isomeric at $\mathrm{C}-5$.

Shiozaki and Nakamura used similar chemistry as part of a synthesis of Sphingofungin E (525, Scheme 172). ${ }^{456}$

Scheme 172. Synthesis of Sphingofungin E.

Addition of dichloromethyllithium to the pyranose $\mathbf{5 2 1}$ took place diastereoselectively, due to steric hindrance from the anomeric axial allyl group. None of the C-2 epimer was observed.

Yoshikawa et al. described a similar strategy during the synthesis of the structurally similar antifungal compound Myriocin (529, Scheme 173). ${ }^{457}$

Scheme 173. Reagents and conditions: LDA ( 2.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 10 equiv.), $-78^{\circ} \mathrm{C}, 15 \mathrm{~min}$; $\mathrm{NaN}_{3}$ (5.0 equiv.), 15 -crown- 5 ( 0.5 equiv.), HMPA, $100^{\circ} \mathrm{C}, 2 \mathrm{~h}$.

The observed diastereoselectivity of dichloromethyllithium addition in this example arises due to steric hindrance from the bulky 1,3-benzylidene group at the C-4 position. Masaki et al. reported that dichlorocarbene, generated from a $\mathrm{CHCl}_{3} / \mathrm{aq} . \mathrm{NaOH} /$ phase transfer catalyst system, took part in a C-H insertion reaction with chiral secondary alcohols (Scheme 174).458, 459

Scheme 174. Insertion of dichlorocarbene. $\mathrm{CTAC}=$ cetyltrimethylammonium chloride. $\mathrm{R}=n$ - $\mathrm{C}_{6} \mathrm{H}_{13}$, $\mathrm{CH}_{2} \mathrm{Ph}, \mathrm{Ph}$

This report particularly interested us since the authors claimed that the insertion was completely stereospecific, allowing the synthesis of enantiomerically pure dichlorocarbinol compounds $\mathbf{5 3 2}$ which were previously inaccessible. The authors then demonstrated that these compounds would undergo a Jocic reaction with either sodium azide or sodium cyanide, in stereospecific fashion (Scheme 175).

Scheme 175. Reagents and conditions: $\mathrm{K}_{2} \mathrm{CO}_{3}$ (5.0 equiv.), MeOH , rt, $10 \mathrm{~min} ; \mathrm{NaN}_{3}$ (3.0 equiv.), 15-crown-5 (1.0 equiv.), THF, rt, $12 \mathrm{~h} ; \mathrm{KCN}$ (3.0 equiv.), 18-crown-6, THF, rt, $12 \mathrm{~h} ; \mathrm{NaBH}_{4}$ (5.0 equiv.), $\mathrm{MeOH}, \mathrm{rt}, 10 \mathrm{~min}$.

In this way compounds $\mathbf{5 3 4}$ and $\mathbf{5 3 6}$ were obtained in > $98 \%$ e.e. The reaction of chloroepoxide $\mathbf{5 3 3}$ with cyanide first yielded the cyanohydrin $\mathbf{5 3 5}$ as a mixture of diastereoisomers, which was reduced to the primary alcohol 536. Interestingly, when phenyl dichlorocarbinol $(\mathrm{R}=\mathrm{Ph})$ was used as the substrate the opposite enantiomer of compounds 534 and 536 was observed. An intramolecular chloride 1,2-shift is one explanation for this double inversion, and the $\alpha$-chloro-aldehyde 537 was indeed isolated (Scheme 176). An alternative mechanism where the chloroepoxide $\mathbf{5 3 3}$ is opened by chloride nucleophile, then substituted by azide in $\mathrm{S}_{\mathrm{N}} 2$ fashion, would also explain this double inversion.

Scheme 176. Observed double inversion of phenyl substrate 532.

The products of the substitution reaction of aldehyde $\mathbf{5 3 7}$ with azide or cyanide still retained $>98 \%$ e.e. The absolute configuration of all the compounds was determined by conversion to the known carboxylic acids and comparison of optical rotations.

### 3.4.2 Synthesis of Dichlorocarbinol Substrates

The stereospecific synthesis of dichlorocarbinols (Scheme 174) seemed desirable to us, since the corresponding racemic substrates ought to be readily synthesised using the well-established $\mathrm{LDA} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ method. Therefore, we first attempted the carbene insertion reaction reported by Masaki et al., using racemic 2-octanol. Unfortunately, the highest conversion achieved was $12 \%$, over a period of four days at $80^{\circ} \mathrm{C}$ using benzyltriethylammonium chloride as the phase transfer catalyst (Scheme 177). This was despite the report claiming an overall yield (after TMS deprotection) of $39 \%$ after 18 hours. Alternative phase transfer catalysts tetra- $n$-butylammonium chloride and cetyltrimethylammonium chloride gave even lower conversions.

Scheme 177. Attempted synthesis of dichlorocarbinols by carbene insertion.

Despite this, dichloromethyllithium readily added to a range of general ketones at $-78^{\circ} \mathrm{C}$, in moderate to good yields (Figure 27). LDA was chosen as the base as there was little difference when lithium dicyclohexylamide was employed, and LDA is generally used more in organic synthesis. The use of less basic amide base LiHMDS gave poor conversion as expected, due to the decreased acidity of dichloromethane. It was found that by washing the organic layer several times with pH 2 buffer during the work up all traces of diisopropylamine could be removed. In some cases this allowed the dichlorocarbinol to be used without any further purification, which represents an improvement on the original protocol. A low temperature was vital because at higher reaction temperatures (e.g. $0{ }^{\circ} \mathrm{C}$ ) the LDA began to degrade, resulting in a lower yield.

Figure 27. Synthesis of dichlorocarbinols. Reagents and conditions: LDA (2.0 equiv.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78$ ${ }^{\circ} \mathrm{C}, 0.5 \mathrm{~h}$. Yields shown for $\mathbf{5 4 2} \mathbf{i} \mathbf{- k}$ and $\mathbf{5 4 2 n}$ are the combined yield of both diastereoisomers. ${ }^{\text {a }}$ Crude yield.

Linear, unbranched alkyl ketones (541a-c) gave good yields of the dichloromethyl adduct. The branched substrates $\mathbf{5 4 1 h}$ and $\mathbf{5 4 1 1}$ gave slightly lower yields, with the tert-butyl substrate 541d significantly lower yielding, presumably due to steric hindrance. The cyclic dichlorocarbinols 542e-g were obtained in similar yields to the trichloromethylation reaction. Compound 542i was obtained as a 1.6:1 ratio of diastereoisomers, which were readily separated by column chromatography (Figure 28).

Figure 28. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio.

Compound 542 $\mathbf{j}$ was obtained as an increased 5.8:1 ratio of diastereoisomers (Figure 29), although these were inseparable by column chromatography. The greater selectivity is due to the proximity of the methyl substituent. The bulkier cyclohexyl group provided an even higher selectivity of $11: 1$ ( $\mathbf{5 4 2 k}$, Figure 30), and the diastereoisomers were separable by column chromatography.

Figure 29. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2} \mathbf{j}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio.

Figure 30. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2 k}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to determine diastereomeric ratio.

The reaction of dichloromethyllithium with $(R)$-pulegone resulted in a selectivity of 13.3:1 (Figure 31), which was the highest observed. These diastereoisomers were also readily separable by column chromatography. The reaction with ketone 541m did not reach full conversion even using extended reaction times. In addition, the product appeared to degrade on silica gel to the ketone starting material, so it was not tested as
a substrate in the reductive Jocic reaction. An attempted reaction using ( $S$ )-camphor failed to give a satisfactory yield of dichlorocarbinol under the optimised conditions.

Figure 31. ${ }^{1} \mathrm{H}$ NMR spectrum obtained from crude mixture of $\mathbf{5 4 2 n}$. Inset: $\mathrm{CHCl}_{2}$ peaks used to measure diastereomeric ratio

### 3.4.3 Jocic Reaction using Hydride Nudeophile

With dichlorocarbinols 542a-n in hand, we then looked to subject them to the same reduction conditions previously developed (section 3.3.2) and in doing so make some comparison to the use of trichlorocarbinol analogues.

### 3.4.4 Results

Table 34 shows our results. The linear, alkyl substrates $\mathbf{b}$ and $\mathbf{c}$ gave the best results in terms of yield, with minimal secondary alcohol $\mathbf{5 4 4}$ being identified by inspection of the crude ${ }^{1} \mathrm{H}$ NMR spectrum (Figure 32). The lower isolated yield of compound 543a may be due to its volatility. All three entries represent an improvement on the trichloro- analogues in both isolated yield and the ratio of 543:544. Dichlorocarbinol 542d failed to undergo the expected reaction, and no identifiable products were observed. This is likely due to the large steric hindrance of the tert-butyl group.

Table 34. Reactions and conditions: $\mathrm{LiBH}_{4}$ (4.0 equiv.), NaOH ( 3.0 equiv.), IPA, rt, 16 h. ${ }^{\text {a }}$ Ratio determined by examination of the crude ${ }^{1} \mathrm{H}$ NMR spectrum. ${ }^{\text {b }}$ Neither product $\mathbf{5 4 3}$ or $\mathbf{5 4 4}$ was observed in the crude mixture. ${ }^{\text {c }}$ Crude yield: product $\mathbf{5 4 3}$ could not be isolated cleanly. ${ }^{\text {d }}$ Major diastereomer was used as the substrate as the minor diastereoisomer was inseparable from impurities. Compound 543e was isolated in a lower yield, although no trace of side product 544e was observed. The medium-sized and large rings (entries $\mathbf{f}$ and $\mathbf{g}$ ) were less suitable substrates, behaviour which was observed for the trichloro-analogues. The reaction with dichlorocarbinol 542f, although yielding no trace of secondary alcohol side product, gave an alkene side product not observed in any other entries. The proposed mechanistic justification for this will be discussed in section 3.4.5. The reaction with dichlorocarbinol 542g showed the lowest 543:544 ratio of all the entries, although it still represents a seven-fold improvement over the trichloro- analogue. Notably, the corresponding trichlorocarbinol for entry $\mathbf{h}$ gave the secondary alcohol in almost a 1:1 ratio. The reactions with single diastereoisomers (cis-542i, trans-542i, 542k) and a mixture of diastereoisomers (542j) will be discussed more fully in section 3.4.6.

Dichlorocarbinol 5421 gave a moderate yield of the desired primary alcohol, with none of the secondary alcohol being observed. The reaction with $\mathbf{5 4 2 n}$ yielded none of the desired product, although peaks consistent with $\mathrm{S}_{\mathrm{N}} 2^{\prime}$ addition of hydride to the alkene were observed in ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture.

Figure 32. Top ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the crude mixture of 543b. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: 2-nonanol.

### 3.4.5 MechanismConsiderations

The potential mechanism by which the secondary alcohol $\mathbf{5 4 4}$ is formed is shown in scheme 178. It is clear from our results that the elimination of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ from compound 542 to form the ketone $\mathbf{5 4 7}$ (path b) must be slower than the corresponding elimination of $\mathrm{CHCl}_{3}$. This would be expected due to the increased acidity of $\mathrm{CHCl}_{3}$ compared to $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. For many of the substrates reaction pathway b became negligible.

Scheme 178. Formation of alcohols 543 and 544.

From the reaction of dichlorocarbinol $\mathbf{5 4 2 f}$ the allylic alcohol $\mathbf{5 4 8}$ was formed, and it was inseparable from the desired primary alcohol 543f (Scheme 179).

Scheme 179. Possible mechanism for the formation of an allylic alcohol side product.

It was interesting to note that in none of the experiments run was any ring opening at the non-chlorinated carbon of the intermediate chloroepoxide observed. For the analogous dichloroepoxide this might be expected mainly on the grounds of electronics, since the epoxide ring opening likely involves a "late" $\mathrm{S}_{\mathrm{N}} 2$ transition state. Lengthening of the $\mathrm{C}-\mathrm{O}$ bond causes a build-up of positive charge on the carbon atom, and the chlorine atoms will raise the energy of TS2 relative to TS1 (Figure 33).

Figure 33. Illustration of possible transition states in the ring opening of gem-dichloroepoxides.

Evidently, one chlorine atom is enough to sufficiently raise the energy barrier for this pathway to still be negligible. Comparison of the ${ }^{1} \mathrm{H}$ NMR spectra of the independently synthesised tertiary alcohol $\mathbf{5 4 9}$ with that of the crude reaction mixture obtained from dichlorocarbinol 542c illustrates this (Figure 34). Tertiary alcohol 549 was synthesised by addition of MeMgBr to 2-decanone (Scheme 180).

Figure 34. Top ${ }^{1} \mathrm{H}$ NMR spectrum: crude reaction mixture of 543c. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: tertiary alcohol 549.

Scheme 180. Synthesis of tertiary alcohol 549.

As can be seen in figure 34, no tertiary alcohol was observed in the Jocic reaction of dichlorocarbinol 542c, corresponding to complete regioselectivity for the nonchlorinated carbon. Non-chlorinated epoxides will generally react with a hydride nucleophile at the less hindered end. For example, epoxide 550 (synthesised independently using a Corey-Chaykovsky reaction, ${ }^{460}$ scheme 181) was subjected to our reduction conditions (Scheme 182) and the crude ${ }^{1} \mathrm{H}$ NMR spectrum was examined (Figure 35).

Scheme 181. Synthesis of epoxide 550 using a Corey-Chaykovsky reaction.

Scheme 182. Reaction of epoxide $\mathbf{5 5 0}$ with $\mathrm{LiBH}_{4}$ and NaOH .

Figure 35. ${ }^{1} \mathrm{H}$ NMR spectra from top to bottom: starting material epoxide 550; tertiary alcohol 549; primary alcohol 543c; crude reaction mixture of epoxide $\mathbf{5 5 0}$ subjected to our Jocic reduction conditions.

As can be seen from the ${ }^{1} \mathrm{H}$ NMR spectra, under our Jocic reaction conditions the epoxide $\mathbf{5 5 0}$ undergoes ring opening at the less hindered end, and the reaction only reached $\sim 75 \%$ conversion. No trace of the primary alcohol resulting from attack at the more hindered end of the epoxide was observed.

### 3.4.6 Stereochemistry

The separation by column chromatography of the cis and trans diastereoisomers of dichlorocarbinol 542i allowed us to gain some insight into the stereochemistry of the Jocic reaction under these conditions. Therefore, each single isolated diastereoisomer and a mixture of the two diastereoisomers was reacted under the same conditions and the reaction mixtures were analysed by ${ }^{1} \mathrm{H}$ NMR spectroscopy (Figure 36).

Figure 36. Top ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of a mixture of both $\mathbf{5 4 2} \mathbf{i}$
diastereoisomers. Middle ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of the more polar diastereoisomer of 542i. Bottom ${ }^{1} \mathrm{H}$ NMR spectrum: obtained from the reaction of the less polar diastereoisomer of $\mathbf{5 4 2}$ i.

Figure 37. Magnification of $\alpha-\mathrm{CH}$ peaks.

Note that the relative configuration was not known prior to carrying out the Jocic reaction. Each diastereoisomer was crystalline but unfortunately we were not able to grow suitable crystals for X-ray crystallography.

Although the relative stereochemistry of each diastereoisomer of $\mathbf{5 4 2} \mathbf{i}$ was not known beforehand, the Jocic reaction is known to go with inversion. The cis- and transalcohols 543i were known in the literature, ${ }^{461,462}$ so by identifying the relative stereochemistry of the primary alcohol products we were able to tentatively assign the stereochemistry of the starting materials (Scheme 183). In this way, the less polar diastereoisomer of $\mathbf{5 4 2} \mathbf{i}$ was assigned as cis, and the more polar diasteroisomer was assigned as trans. The ${ }^{1} \mathrm{H}$ NMR spectra established that none of the opposite diastereoisomer was present in each reaction. This indicates that the reaction is highly stereospecific, and that no epimerisation of the $\mathrm{C}-1$ stereocentre is taking place during the reaction.

Scheme 183. Inversion of configuration at the C-1 centre during the Jocic reaction.

Compound 542k was reacted as the major diastereoisomer only, since the minor diastereoisomer could not be isolated cleanly. NMR data for the resulting 2cyclohexylcyclohexyl methanol product 543k was not available, which made analysis
of the reaction stereochemistry difficult, although there appeared to be only a single diastereoisomer with a negligible presence of the secondary alcohol (Figure 38).

Figure 38. ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture from the Jocic reaction of dichlorocarbinol $\mathbf{5 4 2 k}$.

However, the melting point $\left(56-57^{\circ} \mathrm{C}\right)$ agreed reasonably well with the literature for the cis diastereoisomer (lit. 62-63 ${ }^{\circ} \mathrm{C}^{463}$ ). The melting point of the trans diastereoisomer was reported to be $160-162{ }^{\circ} \mathrm{C}$ from the same reference. Thus, the major diastereoisomer of dichlorocarbinol 542k can tentatively be assigned as cis, which is as expected due to attack of dichloromethyllithium at the less hindered face of the cyclohexanone ring.

Compound 542j was reacted as an inseparable 5.8:1 mixture of diastereoisomers. The ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture (Figure 39) suggested an increased 33:1 ratio of diastereoisomers, with the major isomer agreeing with literature data for the cis configured alcohol 543j. ${ }^{464}$ This suggests a cis-configuration for the major diastereoisomer of the dichlorocarbinol $\mathbf{5 4 2} \mathbf{j}$. The diastereoisomers of the product alcohol $\mathbf{5 4 3} \mathbf{j}$ were separable by column chromatography.

Figure 39. ${ }^{1} \mathrm{H}$ NMR spectrum of the crude mixture from the Jocic reaction with dichlorocarbinol 542j. Inset: $\mathrm{CH}_{3} \mathrm{CH}$ doublets used to determine the diastereomeric ratio.

### 3.5 Other Nudeophiles

Phenoxide had previously been shown by Fechtel et al. to participate in a Jocic reaction with secondary dichlorocarbinols to yield $\alpha$-substituted aldehydes. However, we found that treatment of the tertiary dichlorocarbinol 542c with $p$-methoxyphenol and NaOH yielded a mixture of products $\mathbf{5 5 1}$ and 552, from the Cannizzaro reaction of the $\alpha$-substituted aldehyde (Scheme 184).

Scheme 184. Attempted Jocic reaction with a phenoxide nucleophile. $\mathrm{R}=p-\mathrm{OCH}_{3} \mathrm{C}_{6} \mathrm{H}_{4}$.

We imagined that the use of a strong, non-nucleophilic organic base would prevent the aldehyde product from undergoing a Cannizzaro reaction. Accordingly, treatment of dichlorocarbinol 542c with triazabicyclodecene (TBD) and p-methoxyphenol in IPA solvent yielded the $\alpha$-disubstituted aldehyde $\mathbf{5 5 3}$ smoothly (Scheme 185).

Scheme 185. Synthesis of $\alpha$-aryloxyaldehyde 553. $\mathrm{R}=p-\mathrm{OCH}_{3} \mathrm{C}_{6} \mathrm{H}_{4}$.

### 3.6 Condusions and Future Work

The Jocic reaction with a hydride nucleophile, as first described by Snowden et al. for secondary trichlorocarbinols, was applied to tertiary trichlorocarbinol substrates for the first time. With tertiary trichlorocarbinols, elimination of $\mathrm{CHCl}_{3}$ was observed which ultimately led to the formation of significant quantities of a secondary alcohol side product. This side product was often inseparable from the desired primary alcohol, making purification difficult. In spite of this, the reaction was shown to be highly stereospecific when an enantiomerically pure, tertiary trichlorocarbinol was used as the substrate. This reaction ultimately led to the stereoselective synthesis of $(R)$-dihydrocitronellol and ( $3 R, 7 R$ )-hexahydrofarnesol.

The use of dichlorocarbinols, synthesised by straightforward addition of lithiated dichloromethane to ketones, greatly improved the Jocic procedure and little to no side products were observed in this reaction. Several cyclohexanones containing a stereogenic centre could be dichloromethylated with good diastereoselectivity. Moreover, the addition of hydride to these substrates was shown to be both highly regioselective and highly stereospecific. No epimerisation of the newly generated stereogenic centre was observed in the reaction.

Clearly, a more comprehensive study of the reaction using enantiomerically pure substrates would be desirable. Currently no methods exist for the enantioselective synthesis of tertiary dichlorocarbinols, bar the carbene insertion reported by Masaki et al., ${ }^{458,459}$ which in our hands failed for alkyl secondary alcohols. For aryl substrates more promising results have been obtained by another member of the group.

One additional nucleophile (phenoxide) was used in the Jocic reaction (Scheme 185). Other nucleophiles could be explored - for example $N$-based nucleophiles or $S$-based
nucelophiles. The use of bidentate nucleophiles could generate substituted cyclic structures as has been shown by Perryman et al. ${ }^{361}$

Sugar-derived ketones have been shown to provide excellent selectivity for the addition of both trichloromethide and dichloromethide. ${ }^{366,} 370-372,455-457$ Subsequent Jocic reactions on these stereochemically pure compounds has largely been restricted to the use of azide nucleophiles. We envisage that the use of our developed conditions could provide a highly stereospecific route to one-carbon homologated sugar compounds. This approach would be especially versatile for glucose since the hydroxyls at the C-2, C-3, C-4 and C-6 positions can be selectively protected. ${ }^{465}$

### 3.7 Experimental Section

All the reagents and solvents used were purchased from Sigma-Aldrich, Alfa-Aesar, TCI, Fluorochem or Acros Organics and were used as received unless stated otherwise. Solvents were dried over $3 \AA$ or $4 \AA$ molecular sieves when necessary.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AVII-700 MHz, AVIII HD-500 MHz, AVIII HD-400 MHz, AVIII HD-300 MHz or AV-300 MHz Fourier transform spectrometer, at room temperature unless stated otherwise. Chemical shifts are quoted in parts per million (ppm) downfield from tetramethylsilane. Solvents were used as an internal standard when assigning NMR spectra ( $\delta_{\mathrm{H}}: \mathrm{CDCl}_{3} 7.26 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD} 3.31$ $\mathrm{ppm},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO} 2.50 \mathrm{ppm}, \mathrm{D}_{2} \mathrm{O} 4.79 \mathrm{ppm} ; \delta_{\mathrm{c}}: \mathrm{CDCl}_{3} 77.1 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD} 49.0 \mathrm{ppm}$, $\left.\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO} 39.5 \mathrm{ppm}\right)$. Coupling constants $(J)$ are quoted in Hertz $(\mathrm{Hz})$ and rounded to the nearest 0.5 Hz . Abbreviations used in the descriptions of spectra are as follows; s $=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, quin. $=$ quintet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad. ${ }^{13} \mathrm{C}$ NMR spectra were recorded with proton decoupling and the spectra were assigned on the basis of COSY, PENDANT, HSQC and HMBC experiments.

Infrared spectra were recorded on a Bruker ALPHA platinum ATR spectrometer using OPUS software and are quoted in wavenumbers $\left(\mathrm{cm}^{-1}\right)$.

HPLC data were obtained on a Varian Prostar 335LC detector using a Chiralcel Daicel AD-H column ( $4.6 \mathrm{~mm} \times 250 \mathrm{~mm}$ ), with a solvent system of $n$-hexane:2-propanol.

Melting points for solid crystalline products were determined using a Stuart Scientific SMP10 Digital Melting Point Apparatus, with a range given in ${ }^{\circ} \mathrm{C}$ and rounded to the nearest degree. The melting points are uncorrected.

Gas chromatography mass spectrometry (GC/MS) data was recorded on a Varian 3800-4000 GC-MS machine.

Thin Layer Chromatography (TLC) was carried out using silica coated ( 0.25 mm ) alumina plates, and the plates were visualised using UV light or by staining with $\mathrm{KMnO}_{4}$.

## (R)-4,4,4-Trichloro-3-methylbutane-1,3-diol 473

To a solution of ( $R$ )-4-methyl-4-(trichloromethyl)oxetan-2-one 171 ( $0.221 \mathrm{~g}, 1.02$ mmol) in dry THF ( 5 mL ) was added $\mathrm{LiBH}_{4}(66.0 \mathrm{mg}, 3.00 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ under nitrogen. The mixture was stirred at this temperature until the reaction was complete by TLC, then quenched with water and filtered through celite with EtOAc. The solvent was removed in vacuo to yield product as a white solid ( $0.204 \mathrm{~g}, 99 \%$ ). The compound was used without further purification. $v\left(\mathrm{~cm}^{-1}\right) ; 3357$ (br, O-H stretch), 1129 (C-O stretch), $788(\mathrm{C}-\mathrm{Cl}$ stretch $) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 4.07-3.88\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OH}\right)$, $3.49(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.47\left(1 \mathrm{H}\right.$, dddd, $\left.J 15,9.5,4.5,0.5, \mathrm{CHHCH}_{2} \mathrm{OH}\right), 2.16(1 \mathrm{H}, \mathrm{t}, J 5$, $\mathrm{OH}), 2.09\left(1 \mathrm{H}, \mathrm{ddd}, J 15,4.5,3.5, \mathrm{CHHCH}_{2} \mathrm{OH}\right), 1.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 109.0\left(\mathrm{CCl}_{3}\right), 83.5\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)\right)$, $59.8\left(\mathrm{CH}_{2} \mathrm{OH}\right), 37.1\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right), 22.6$ $\left(\mathrm{CH}_{3}\right) ;$ m.p $=64-65^{\circ} \mathrm{C} ;[\alpha]_{\mathrm{D}}{ }^{25}-7.5\left(c 1, \mathrm{CHCl}_{3}\right)$.

## (R)-1,1,1-Trichloro-2-methyl-4-((triisopropylsilyl)oxy)butan-2-ol 474

To a solution of ( $R$ )-4,4,4-trichloro-3-methylbutane-1,3-diol 473 ( $0.204 \mathrm{~g}, 0.990$ mmol ) in DMF ( 2 mL ) was added imidazole ( $0.135 \mathrm{~g}, 1.98 \mathrm{mmol}$ ) and triisopropylsilyl chloride $(0.250 \mathrm{~mL}, 1.19 \mathrm{mmol})$ under nitrogen, and the solution was stirred at room temperature overnight. The reaction was quenched with saturated $\mathrm{NaHCO}_{3}$ (aq.) and
extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic fractions were washed with pH 2 buffer, water and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo and the residue was purified by column chromatography ( $40: 1$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ) to yield product as a colourless oil ( $0.212 \mathrm{~g}, 59 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3434$ (br, O-H stretch), 2925 (CH stretch), 1106 (C-O stretch), 1085 (Si-O stretch), 797 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 4.99(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.14-4.04\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OSi}\right), 2.48(1 \mathrm{H}, \mathrm{ddd}, J$ 14.5, 10, 4.5, $\mathrm{CHHCH}_{2} \mathrm{OSi}$ ), 2.01 ( 1 H, ddd, $J 14.5,4,3, \mathrm{CHHCH}_{2} \mathrm{OSi}$ ), $1.66(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.19-1.06\left(21 \mathrm{H}, \mathrm{m}, \mathrm{Si}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 109.2$ $\left(\mathrm{CCl}_{3}\right), 83.0\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 60.9\left(\mathrm{CH}_{2} \mathrm{OSi}\right), 37.1\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OSi}\right), 27.8\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 18.1$ $\left(\mathrm{SiCHCH}_{3}\right), 11.8\left(\mathrm{SiCHCH}_{3}\right) ;$ HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd. for $\mathrm{C}_{14} \mathrm{H}_{29}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{2} \mathrm{Si}$ $[\mathrm{M}+\mathrm{Na}]^{+} 385.0895$, found 385.0892; [ $\left.\alpha\right]_{\mathrm{D}}{ }^{25}-20.7$ (c 1.98, $\mathrm{CHCl}_{3}$ ).

## (R)-2-Methyl-4-((triisopropylsilyl)oxy)butan-1-ol 475

To a solution of ( $R$ )-1,1,1-trichloro-2-methyl-4-((triisopropylsilyl)oxy)butan-2-ol 474 $(0.210 \mathrm{~g}, 0.580 \mathrm{mmol})$ in dry propan-2-ol ( 2 mL ) was added $\mathrm{LiBH}_{4}(51.0 \mathrm{mg}, 2.32$ mmol) and freshly powdered $\mathrm{NaOH}(70.0 \mathrm{mg}, 1.74 \mathrm{mmol})$ under nitrogen. The mixture was stirred at $40^{\circ} \mathrm{C}$ until the reaction was complete by TLC $(17 \mathrm{~h})$, when it was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) ( 5 mL ). The aqueous phase was saturated with solid NaCl and extracted with EtOAc. The combined organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (9:1 petroleum ether/EtOAc) to yield product as a colourless oil (97.0 mg, 64\%).v ( $\mathrm{cm}^{-1}$ ); 3342 (br, O-H stretch), 2941 (C-H stretch), 1095 (Si-O stretch), 678 (Si-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ 3.88-3.81 ( $1 \mathrm{H}, \mathrm{m}$, CHHOSi), 3.78-3.71 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHHOSi}$ ), 3.57-3.49 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHHOH}$ ), $3.43(1 \mathrm{H}, \mathrm{ddd}$,
$J 16,5,2, \mathrm{CHHOH}), 3.09(1 \mathrm{H}, \mathrm{dd}, J 7.5,5.5, \mathrm{OH}), 1.88-1.78\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 1.60-$ $1.55\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OSi}\right), 1.17-1.04\left(21 \mathrm{H}, \mathrm{m}, \mathrm{Si}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{3}\right), 0.92(3 \mathrm{H}, \mathrm{d}, J 7$, $\left.\mathrm{CHCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 68.4\left(\mathrm{CH}_{2} \mathrm{OH}\right), 62.2\left(\mathrm{CH}_{2} \mathrm{OSi}\right), 37.9$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OSi}\right), 34.8\left(\mathrm{CHCH}_{3}\right), 18.1\left(\mathrm{SiCHCH}_{3}\right), 17.6\left(\mathrm{CHCH}_{3}\right), 12.0(\mathrm{SiCHCH} 3)$; LRMS (ESI) $m / z$ : calcd. for $\mathrm{C}_{14} \mathrm{H}_{32} \mathrm{NaO}_{2} \mathrm{Si}[\mathrm{M}+\mathrm{Na}]^{+} 283.5$, found 283.2; $[\alpha]_{\mathrm{D}}{ }^{20}+3.4$ (c $0.36, \mathrm{CHCl}_{3}$ ). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data are consistent with the previously reported data for the ( $S$ ) isomer. ${ }^{295}$

## Ethyl 4,4,4-trichloro-3-hydroxy-3-methylbutanoate 481

To a solution of diisopropylamine ( $0.78 \mathrm{~mL}, 5.5 \mathrm{mmol}$ ) in dry THF ( 5 mL ) was added $n$-BuLi ( $2.0 \mathrm{~mL}, 2.5 \mathrm{M}, 5.0 \mathrm{mmol}$ ), at $0{ }^{\circ} \mathrm{C}$ under nitrogen. The solution was then cooled to $-78^{\circ} \mathrm{C}$ and stirred for one hour, after which time EtOAc ( $0.49 \mathrm{~mL}, 5.0 \mathrm{mmol}$ ) was added. The solution was stirred for a further one hour at $-78{ }^{\circ} \mathrm{C}$ and $1,1,1-$ trichloroacetone $(0.67 \mathrm{~mL}, 6.0 \mathrm{mmol})$ was added. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) after 10 minutes and poured into water. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the combined organic fractions were washed with water and brine. After drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ the solvent was removed in vacuo and the residue was purified by column chromatography ( $9: 1$ petroleum ether/EtOAc), to yield product as a yellow oil $(0.820 \mathrm{~g}, 66 \%) . v\left(\mathrm{~cm}^{-1}\right) ; 3466(\mathrm{br}, \mathrm{O}-\mathrm{H}$ stretch $), 1711(\mathrm{C}=\mathrm{O}$ stretch), 1204 and 1026 (C-O stretch), 789 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 4.65(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.23\left(2 \mathrm{H}, \mathrm{q}, J 7, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.14(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{CHHCO}), 2.86$ (1H, d, J 15.5, CHHCO), $1.71\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.31\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 171.8(\mathrm{CO}), 107.3\left(\mathrm{CCl}_{3}\right), 81.2\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 61.6\left(\mathrm{CH}_{2} \mathrm{O}\right), 40.2$
$\left(\mathrm{CH}_{2} \mathrm{CO}\right)$, $23.5\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, $14.1\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$; HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{7} \mathrm{H}_{11}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{3}[\mathrm{M}+\mathrm{Na}]^{+}$270.9666, found 270.9674.

## 4,4,4-Trichloro-3-methylbutane-1,3-diol ( $\pm$ )-473

To a solution of ethyl 4,4,4-trichloro-3-hydroxy-3-methylbutanoate 481 ( $0.296 \mathrm{~g}, 1.19$ $\mathrm{mmol})$ in dry THF ( 5 mL ) was added $\mathrm{LiBH}_{4}(52.0 \mathrm{mg}, 2.38 \mathrm{mmol})$ under nitrogen at $0^{\circ} \mathrm{C}$. The mixture was stirred at this temperature until the reaction was complete by TLC (four hours). The reaction was quenched with water ( 2 mL ) and saturated $\mathrm{NaHCO}_{3}$ (aq.) ( 3 mL ), filtered through celite and the solvent was removed in vacuo. The residue was purified by column chromatography (6:4 petroleum ether/EtOAc) to yield product as a white solid ( $0.177 \mathrm{~g}, 72 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3358$ (br, O-H stretch), 1128 (C-O stretch), 793 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 4.06-3.94(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{OH}\right), 3.48(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.47\left(1 \mathrm{H}\right.$, dddd, $\left.J 15,9.5,4.5,0.5, \mathrm{CHHCH}_{2} \mathrm{OH}\right), 2.15$ $(1 \mathrm{H}, \mathrm{dd}, J 6,4, \mathrm{OH}), 2.09\left(1 \mathrm{H}, \mathrm{dt}, J 15,4.5, \mathrm{CH} H \mathrm{CH}_{2} \mathrm{OH}\right), 1.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 108.9\left(\mathrm{CCl}_{3}\right)$, $83.4\left(C\left(\mathrm{CH}_{3}\right)\right)$, $59.7\left(\mathrm{CH}_{2} \mathrm{OH}\right), 37.0$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right), 22.5\left(\mathrm{CH}_{3}\right) ;$ m.p $=98-99^{\circ} \mathrm{C}$.

## 1,1,1-Trichloro-2-methyl-4-((triisopropylsilyl)oxy)butan-2-ol ( $\pm$ )-474

To a solution of 4,4,4-trichloro-3-methylbutane-1,3-diol ( $\pm$ )-473 ( $0.222 \mathrm{~g}, 1.07 \mathrm{mmol}$ ) in DMF ( 2 mL ) was added imidazole ( $0.146 \mathrm{~g}, 2.15 \mathrm{mmol}$ ) and triisopropylsilyl chloride ( $0.270 \mathrm{~mL}, 1.28 \mathrm{mmol}$ ) under nitrogen, and the solution was stirred at room temperature overnight. The reaction was quenched with saturated $\mathrm{NaHCO}_{3}$ (aq.) and
extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic fractions were washed with pH 2 buffer, water and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo and the residue was purified by column chromatography ( $40: 1$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ) to yield product as a colourless oil ( $0.272 \mathrm{~g}, 70 \%$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3443$ (br, O-H stretch), 2940 (CH stretch), 1110 (C-O stretch), 884 (Si-O stretch), 797 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.00(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.14-4.04\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OSi}\right), 2.47(1 \mathrm{H}, \mathrm{ddd}, J$ $\left.15,10,5, \mathrm{CHHCH}_{2} \mathrm{OSi}\right), 2.01(1 \mathrm{H}, \mathrm{dt}, J 14.5,3, \mathrm{CHHCH} 2 \mathrm{OSi}), 1.66\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, 1.89-1.01 (21H, m, $\left.\mathrm{Si}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 109.2\left(\mathrm{CCl}_{3}\right), 83.0$ $(\mathrm{C}(\mathrm{OH})), 60.9\left(\mathrm{CH}_{2} \mathrm{OSi}\right), 37.1\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OSi}\right), 22.7\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 18.1\left(\mathrm{SiCHCH}_{3}\right), 11.8$ ( $\mathrm{SiCHCH}_{3}$ ); HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd. for $\mathrm{C}_{14} \mathrm{H}_{29}{ }^{35} \mathrm{Cl}_{3} \mathrm{NaO}_{2} \mathrm{Si}[\mathrm{M}+\mathrm{Na}]^{+}$385.0895, found 385.0893 .

## 2-Methyl-4-((triisopropylsilyl)oxy)butan-1-ol ( $\pm$ )-475

To a solution of 1,1,1-trichloro-2-methyl-4-((triisopropylsilyl)oxy)butan-2-ol ( $\pm$ )-474 $(0.210 \mathrm{~g}, 0.580 \mathrm{mmol})$ in dry propan-2-ol ( 2 mL ) was added $\mathrm{LiBH}_{4}(51.0 \mathrm{mg}, 2.32$ mmol) and freshly powdered $\mathrm{NaOH}(70.0 \mathrm{mg}, 1.74 \mathrm{mmol})$ under nitrogen. The mixture was stirred at $40^{\circ} \mathrm{C}$ until the reaction was complete by TLC $(17 \mathrm{~h})$, when it was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) ( 5 mL ). The aqueous phase was saturated with solid NaCl and extracted with EtOAc. The combined organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (9:1 petroleum ether/EtOAc) to yield product as a colourless oil (0.103 g, 56\%). \%). v (cm ${ }^{-1}$ ); 3327 (br, O-H stretch), 2941 (C-H stretch), 1096 (SiO stretch), 680 (Si-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.88-3.81(1 \mathrm{H}, \mathrm{m}$, CHHOSi), 3.77-3.70 (1H, m, CHHOSi), 3.56-3.49 (1H, m, CHHOH), 3.46-3.40 ( 1 H ,

(S)-(4-Iodo-3-methylbutoxy)triisopropylsilane 488

To a solution of imidazole ( $48.0 \mathrm{mg}, 0.703 \mathrm{mmol}$ ) and $\mathrm{PPh}_{3}(0.175 \mathrm{~g}, 0.670 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ was added $\mathrm{I}_{2}(0.179 \mathrm{~g}, 0.703 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ and the mixture was stirred at this temperature for 15 minutes. (S)-2-Methyl-4-((triisopropylsilyl)oxy)butan-1-ol $475(0.145 \mathrm{~g}, 0.558 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was then added dropwise and the mixture was stirred at room temperature overnight. The reaction was quenched with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ (aq.), extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the solvent was removed in vacuo. Purification by column chromatography ( $100 \%$ petroleum ether) yielded product as an orange oil ( $0.163 \mathrm{~g}, 81 \%$ ). v ( $\mathrm{cm}^{-1}$ ); 2918 (C-H stretch), 1102 (Si-O stretch), 881 (Si-O stretch), 657 (C-I stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.77-3.68(2 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{OSi}$ ), 3.30 ( $1 \mathrm{H}, \mathrm{dd}, J 9.5,4.5, \mathrm{CHHI}$, 3.22 ( $1 \mathrm{H}, \mathrm{dd}, J 9.5,6, \mathrm{CHHI}$ ), 1.73-1.66 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}$ ), 1.66-1.58 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{OSi}$ ), 1.49-1.41 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{OSi}$ ), 1.13-1.02 (21H, m, $\left.\mathrm{Si}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{3}\right), 1.00\left(3 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CHCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 61.1\left(\mathrm{CH}_{2} \mathrm{OSi}\right), 39.5\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OSi}\right), 31.5\left(\mathrm{CHCH}_{3}\right), 20.9\left(\mathrm{CHCH}_{3}\right), 18.5$ $\left(\mathrm{CH}_{2} \mathrm{I}\right), 18.2\left(\mathrm{SiCHCH}_{3}\right), 12.1(\mathrm{SiCHCH} 3) ;$ HRMS (ESI) $m / z:$ calcd. for $\mathrm{C}_{14} \mathrm{H}_{31} \mathrm{INaOSi}$
$[\mathrm{M}+\mathrm{Na}]^{+} 393.1081$, found $393.1067 ;[\alpha]_{\mathrm{D}}{ }^{25}+6.7\left(c 0.39, \mathrm{CHCl}_{3}\right)$. This compound was reported previously but without spectroscopic data. ${ }^{466}$

## (R)-Dihydrocitronellol 487

To a mixture of (S)-(4-iodo-3-methylbutoxy)triisopropylsilane 488 ( $0.486 \mathrm{~g}, 1.35$ mmol ), $\mathrm{CuCl}_{2}(5.50 \mathrm{mg}, 0.0405 \mathrm{mmol})$ and 1-phenyl-1-propyne ( $26.0 \mu \mathrm{~L}, 0.205$ mmol ) in THF ( 4.5 mL ) was added $i$-pentylmagnesium bromide $\mathbf{4 8 6}(1.37 \mathrm{~mL}, 2 \mathrm{M}$ in THF, 2.74 mmol ) at $0{ }^{\circ} \mathrm{C}$. The reaction was stirred for two hours at this temperature then quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.). The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. To a solution of this crude product in THF ( 1.8 mL ) was added TBAF ( $2.00 \mathrm{~mL}, 1 \mathrm{M}$ in THF, 2.00 mmol ) at $0^{\circ} \mathrm{C}$ under nitrogen, then stirred at room temperature for three hours. The reaction was quenched with ice water, extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (9:1 petroleum ether/EtOAc) to yield product as a colourless oil ( $0.144 \mathrm{~g}, 68 \%$ ).v $\left(\mathrm{cm}^{-1}\right) ; 3333(\mathrm{br}$, O-H stretch), 2924 (C-H stretch), 1052 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ 3.74-3.61 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OH}$ ), 1.65-1.06 (10H, m, $\left.\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}\right), 0.94-0.81(9 \mathrm{H}$, overlapping d's, $\left.\mathrm{CH}_{3} \mathrm{CH}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 61.4\left(\mathrm{CH}_{2} \mathrm{OH}\right), 40.1,39.4$, $37.5\left(\mathrm{CH}_{2}\right), 29.6,28.1(\mathrm{CH}), 24.8\left(\mathrm{CH}_{2}\right), 22.8,22.7,19.8\left(\mathrm{CH}_{3}\right) ; \mathrm{GC} / \mathrm{MS}\left(\mathrm{CI}, \mathrm{NH}_{3}\right)$ : $176.1\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$. The spectroscopic data are consistent with that previously reported. ${ }^{450,467}$

## ( $\boldsymbol{R}, \boldsymbol{R}$ )-Hexahydrofarnesol 32

To a solution of $(R)$-dihydrocitronellol $487(0.128 \mathrm{~g}, 0.810 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ was added $\mathrm{PPh}_{3}(0.255 \mathrm{~g}, 0.972 \mathrm{mmol})$, and the mixture was cooled to $0{ }^{\circ} \mathrm{C} . \mathrm{N}$ bromosuccinimide ( $0.160 \mathrm{~g}, 0.899 \mathrm{mmol}$ ) was then added in portions over a period of 30 minutes, at $0{ }^{\circ} \mathrm{C}$. The reaction was stirred for a further 20 minutes at room temperature, then the solvent was removed under a flow of nitrogen. The residue was passed through a short plug of silica eluting with $n$-pentane, to yield ( $R$ )-1-bromo-3,7dimethyloctane $489(0.160 \mathrm{~g}, 89 \%)$ as a colourless oil. This compound was used immediately in the next step. A solution of bromide 489 ( $0.136 \mathrm{~g}, 0.615 \mathrm{mmol}$ ) in dry THF ( 0.5 mL ) was added to magnesium turnings ( $22.0 \mathrm{mg}, 0.923 \mathrm{mmol}$ ) in THF ( 0.5 mL ), and the mixture was stirred at room temperature for 30 minutes then at reflux temperature for two hours. A solution of this Grignard reagent $\mathbf{4 9 0}$ was then added to a solution of iodide $(S)-\mathbf{4 8 8}(0.111 \mathrm{~g}, 0.308 \mathrm{mmol}), \mathrm{CuCl}_{2}(4.00 \mathrm{mg}, 0.0308 \mathrm{mmol})$ and 1-phenyl-1-propyne ( $5.70 \mu \mathrm{~L}, 0.0462 \mathrm{mmol}$ ) in dry THF $(1.5 \mathrm{~mL})$, at $0{ }^{\circ} \mathrm{C}$. The resultant solution was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 minutes then at room temperature for a further two hours. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.), extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The protected alcohol 491 was used directly in the next step as a crude material. To a solution of 491
in THF ( 0.7 mL ) was added TBAF ( $1 \mathrm{M}, 0.616 \mathrm{~mL}, 0.616 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$, under nitrogen. The solution was warmed to room temperature and stirred until the reaction was complete by TLC (three hours). The reaction was quenched with cold water, extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The crude residue was purified by column chromatography (100\% petroleum ether to 9:1 petroleum ether/EtOac to $85: 15$ ) to yield $(R, R)$-hexahydrofarnesol 32 as a colourless oil ( $9 \mathrm{mg}, 13 \%$ from iodide ( $S$ )-488). The title compound was inseparable from impurities. Only ${ }^{1} \mathrm{H}$ NMR and GC/MS (EI) data were obtained. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right)$ 3.76-3.59 (2H, m, $\left.\mathrm{CH}_{2} \mathrm{OH}\right)$, 1.67-0.99 (18H, m, CH $\mathrm{CH}_{2}$ and CH$), 0.94-0.79(12 \mathrm{H}$, m, $\mathrm{CH}_{3} \mathrm{CH}$ ); GC/MS (EI): $210.0\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$. The ${ }^{1} \mathrm{H}$ NMR data are consistent with that previously reported. ${ }^{450}$

## Preparation of lithium hexamethyldisilazide (LiHMDS)

A solution of 1M LiHMDS can be prepared by the following procedure. A solution of hexamethyldisilazane (HMDS) ( $0.23 \mathrm{~mL}, 1.1 \mathrm{mmol}$ ) in dry THF ( 0.37 mL ) was placed under nitrogen and cooled to $-78^{\circ} \mathrm{C} . n-\operatorname{BuLi}(2.5 \mathrm{M}$ in THF, $1.00 \mathrm{mmol}, 0.40 \mathrm{~mL})$ was then added dropwise, and the solution was stirred at $-78^{\circ} \mathrm{C}$ for 30 minutes. After this time the LiHMDS was used in the reactions shown below.

## Synthesis of Trichloromethyl Carbinols: General Procedure 1

To a solution of ketone ( 1.00 equiv.) and dry $\mathrm{CHCl}_{3}$ ( 2.50 equiv.) in dry THF (4 $\mathrm{mL} / \mathrm{mmol}$ ketone), was added freshly prepared LiHMDS (1.00 M in THF, 2.20 equiv.) dropwise at $-78{ }^{\circ} \mathrm{C}$, under nitrogen. The mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for one hour then quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.). The product was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the
combined organic fractions were washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (petroleum ether/EtOAc).

## Synthesis of Trichloromethyl Carbinols: General Procedure 2

To a solution of ketone (1.00 equiv.) in dry $\mathrm{CHCl}_{3}$ ( 2.00 equiv.) was added DBU (1.00 equiv.) under nitrogen. The mixture was stirred at room temperature for 24 hours, diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with 1 M HCl (aq.), water and brine. The solvent was removed in vacuo and the residue was purified by column chromatography (petroleum ether/EtOAc).

## 1,1,1-Trichloro-2,4-dimethylpentan-2-ol 505a

The compound was prepared according to General Procedure 1 (using $0.120 \mathrm{~mL}, 1.00$ mmol 4-methylpentan-2-one 504a) to yield product as a yellow oil ( $0.138 \mathrm{~g}, 63 \%$ ) after column chromatography (95:5 petroleum ether/EtOAc). v $\left(\mathrm{cm}^{-1}\right) ; 3451$ (br, O-H stretch), 1131 (C-O stretch), 774 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 2.23$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.98-1.88\left(2 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HC}(\mathrm{OH})\right.$ and $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.83-1.75(1 \mathrm{H}, \mathrm{m}$, $\mathrm{CH} H \mathrm{C}(\mathrm{OH})), 1.60\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.06\left(3 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}\right), 1.01(3 \mathrm{H}, \mathrm{d}, J 6.5$, $\left.\mathrm{CH}_{3} \mathrm{CH}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 110.6\left(\mathrm{CCl}_{3}\right), 83.6(\mathrm{C}(\mathrm{OH})), 43.8\left(\mathrm{CH}_{2}\right)$, 25.2, $25.1\left(\mathrm{CH}_{3} \mathrm{CH}\right), 23.9\left(\mathrm{CH}_{3} \mathrm{CH}\right)$, $21.5\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$; GC/MS (EI): 130.0, 132.0 [M$\left.\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$. This compound was previously reported without spectroscopic data. ${ }^{468}$

## 1,1,1-Trichloro-2-methylheptan-2-ol 505b

The compound was prepared according to General Procedure 1 (using $0.290 \mathrm{~mL}, 2.00$ mmol 2-heptanone 504b) to yield product as a colourless oil ( $0.429 \mathrm{~g}, 92 \%$ ) after column chromatography (95:5 petroleum ether/EtOAc). v ( $\mathrm{cm}^{-1}$ ); 3456 (br, O-H stretch), 2925 (C-H stretch), 1139 (C-O stretch), 787 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.23(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.00-1.90\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right) 1.62-1.52(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.56\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.50-1.40\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.39-$ $1.29\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.92\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J} 7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 110.4$ $\left(\mathrm{CCl}_{3}\right)$, $83.2(\mathrm{C}(\mathrm{OH})), 35.8\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $32.3\left(\mathrm{CH}_{2}\right), 24.2\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, 22.8 $\left(\mathrm{CH}_{2}\right), 21.3\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 14.2\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 143.2\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$. This compound was previously reported without ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data. ${ }^{469,470}$

## 1,1,1-Trichloro-2-methylnonan-2-ol 505c

The compound was prepared according to General Procedure 1 (using $0.35 \mathrm{~mL}, 2.00$ mmol 2-nonanone 504c) to yield product as a colourless oil (0.376 g, 72\%) after column chromatography (95:5 petroleum ether/EtOAc). v $\left(\mathrm{cm}^{-1}\right) ; 3452$ (br, O-H stretch), 2955 (C-H stretch), 1139 (C-O stretch), 788 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.24(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.00-1.89\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.62-1.51(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.49-1.39\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.38-$ $1.22\left(8 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.94-0.82\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 110.4$ $\left(\mathrm{CCl}_{3}\right), \quad 83.2(\mathrm{C}(\mathrm{OH})), \quad 35.8\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), \quad 31.9, \quad 30.1, \quad 29.4 \quad\left(\mathrm{CH}_{2}\right), \quad 24.5$
$\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $22.8\left(\mathrm{CH}_{2}\right)$, $21.3\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, $14.2\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): 171.2 $\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$.

## 1,1,1-Trichloro-2-methyldecan-2-ol 505d

The compound was prepared according to General Procedure 1 (using $0.380 \mathrm{~mL}, 2.00$ mmol 2-decanone 504d) to yield product as a colourless oil ( $0.380 \mathrm{~g}, 69 \%$ ) after column chromatography (95:5 petroleum ether/EtOAc). v ( $\mathrm{cm}^{-1}$ ); 3452 (br, O-H stretch), 2924 (C-H stretch), 1105 (C-O stretch), 785 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.22(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.00-1.89\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.61-1.51(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.56\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.49-1.39\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.39-$ $1.22\left(10 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.92-0.85\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta$ $110.4\left(\mathrm{CCl}_{3}\right)$, $83.2(\mathrm{C}(\mathrm{OH})), 35.9\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 32.0,30.2$, 29.7, $29.4\left(\mathrm{CH}_{2}\right), 24.5$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $22.8\left(\mathrm{CH}_{2}\right)$, $21.3\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, $14.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): 185.2 $\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$.

## 5-(Trichloromethyl)nonan-5-ol 505e

The compound was prepared according to General Procedure 1 (using $0.340 \mathrm{~mL}, 2.00$ mmol 5-nonanone 504e) to yield product as a colourless oil ( $0.319 \mathrm{~g}, 61 \%$ ) after column chromatography (95:5 petroleum ether/EtOAc). v $\left(\mathrm{cm}^{-1}\right) ; 3473$ (br, O-H stretch), 2958 (C-H stretch), 1131 (C-O stretch), 776 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.26(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.05-1.87\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.52-1.42(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.41-1.31\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 0.95\left(6 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 110.7\left(\mathrm{CCl}_{3}\right)$, $83.9(\mathrm{C}(\mathrm{OH}))$, $35.2\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 27.1$
$\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 23.6\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 14.2\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 225\left[\mathrm{M}-{ }^{-37} \mathrm{Cl}\right]^{+}, 189.2$ $\left[\mathrm{M}-\mathrm{Cl}_{2}\right]^{+}, 171.2\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$. This compound was previously reported without ${ }^{1} \mathrm{H}$ or ${ }^{13} \mathrm{C}$ NMR data. ${ }^{470}$

1-(Trichloromethyl)cyclopentan-1-ol 505f

The compound was prepared according to General Procedure 2 (using $0.890 \mathrm{~mL}, 10.0$ mmol cyclopentanone $\mathbf{5 0 4 f}$ ) to yield product as a white solid ( $0.872 \mathrm{~g}, 43 \%$ ) after column chromatography (9:1 petroleum ether/EtOAc). v ( $\mathrm{cm}^{-1}$ ); 3399 (br, O-H stretch), 2964 (C-H stretch), 772 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 2.40$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.39-2.30(2 \mathrm{H}, \mathrm{m}, \mathrm{CHHC}(\mathrm{OH})), 2.00-1.90\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right)$, 1.88-1.75 (4H, m, $\mathrm{CHHC}(\mathrm{OH})$ and $\mathrm{CHHCH} 2 \mathrm{C}(\mathrm{OH})) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta$ $107.5\left(\mathrm{CCl}_{3}\right)$, $92.6(\mathrm{C}(\mathrm{OH})), 37.4\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 25.6\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$; GC/MS (EI): $97\left[\mathrm{M}-\mathrm{Cl}_{3}\right]^{+} ; \mathrm{m} . \mathrm{p}=35-36^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{471}$

## 1-(Trichloromethyl)cyclohexan-1-ol 505g

The compound was prepared according to General Procedure 1 (using $0.210 \mathrm{~mL}, 2.00$ mmol cyclohexanone $\mathbf{5 0 4 g}$ ) to yield product as a white solid ( $0.241 \mathrm{~g}, 55 \%$ ) after column chromatography (92:8 petroleum ether/EtOAc). v $\left(\mathrm{cm}^{-1}\right) ; 3451$ (br, O-H stretch), 2936 (C-H stretch), 1159 (C-O stretch), 773 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.13-2.01(3 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HC}(\mathrm{OH})$ and OH$), 1.90(2 \mathrm{H}, \mathrm{td}, J 13.5,4$,
$\mathrm{CHHC}(\mathrm{OH})), 1.78-1.69\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right.$ and $\left.\mathrm{CHHCH}_{2} \mathrm{CH}_{2}\right), 1.63(2 \mathrm{H}, \mathrm{qt}, J$ $\left.13,3.5, \mathrm{CHHCH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.21-1.10\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125\right.$ $\mathrm{MHz}) \delta 110.5\left(\mathrm{CCl}_{3}\right), 81.9(\mathrm{C}(\mathrm{OH})), 31.4\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 25.1\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 22.0$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 181.1\left[\mathrm{M}-{ }^{35} \mathrm{Cl}\right]^{+}, 163.2\left[\mathrm{M}-{ }^{35} \mathrm{ClH}_{2} \mathrm{O}\right]^{+} ;$m.p $=60-61$ ${ }^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{471}$

## 1-(Trichloromethyl)cyclooctan-1-ol 505h

The compound was prepared according to General Procedure 1 (using 0.252 g, 2.00 mmol cyclooctanone $\mathbf{5 0 4 h}$ ) to yield product as a colourless oil ( $0.260 \mathrm{~g}, 53 \%$ ) after column chromatography (9:1 petroleum ether/Et2O). v $\left(\mathrm{cm}^{-1}\right) ; 3453$ (br, O-H stretch), 2920 (C-H stretch), 1138 (C-O stretch), 757 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$ $\mathrm{MHz}) \delta$ 2.29-2.08 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})$ ), 1.85-1.73 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})$ ), 1.72-1.59 $\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.58-1.44\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 111.4\left(\mathrm{CCl}_{3}\right)$, $84.2(\mathrm{C}(\mathrm{OH}))$, $31.9\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $27.8\left(\mathrm{CH}_{2}\right)$, $24.6\left(\mathrm{CH}_{2}\right)$, $22.4\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$; GC/MS (EI): $191.1\left[\mathrm{M}_{-3}{ }^{37} \mathrm{ClH}_{2} \mathrm{O}\right]^{+}, 155.2\left[\mathrm{M}-{ }^{35} \mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$.

## 1-(Trichloromethyl)cyclododecan-1-ol 505i

The compound was prepared according to General Procedure 1 (using $0.354 \mathrm{~g}, 2.00$ mmol cyclododecanone 504i) to yield product as a colourless oil ( $0.400 \mathrm{~g}, 67 \%$ ) after column chromatography (95:5 petroleum ether/EtOAc). v $\left(\mathrm{cm}^{-1}\right) ; 3453$ (br, O-H
stretch), 2927 (C-H stretch), 1067 (C-O stretch), 785 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.28(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.06-1.90\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.64-1.46(4 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})$ ), 1.45-1.30 (14H, m, CH2 $) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 109.9$ $\left(\mathrm{CCl}_{3}\right)$, $84.8(\mathrm{C}(\mathrm{OH}))$, $31.6\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $26.8\left(\mathrm{CH}_{2}\right), 26.2\left(\mathrm{CH}_{2}\right)$, $22.8\left(\mathrm{CH}_{2}\right), 22.3$ $\left(\mathrm{CH}_{2}\right)$, $21.2\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 229.3\left[\mathrm{M}-{ }^{35} \mathrm{Cl}_{2}\right]^{+}$.

## Jocic Reaction: General Procedure 3

To a solution of trichloromethylcarbinol (1.00 equiv.) in dry propan-2-ol ( $4 \mathrm{~mL} / \mathrm{mmol}$ substrate) was added $\mathrm{LiBH}_{4}$ (4.00 equiv.) and NaOH (3.00 equiv.) under nitrogen, and stirred for 16 hours at $40^{\circ} \mathrm{C}$. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) and brine was added. The product was extracted with EtOAc (5 x 10 mL ), the combined organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vасиo. The residue was purified by column chromatography (petroleum ether/EtOAc).

## 2,4-Dimethylpentan-1-ol 506a

The reaction was carried out according to General Procedure 3 (using $0.268 \mathrm{~g}, 1.22$ mmol 1,1,1-trichloro-2,4-dimethylpentan-2-ol 505a) to yield crude product as a colourless oil ( $20.0 \mathrm{mg}, 14 \%$ ). Integration of the peaks at $3.95-3.80 \mathrm{ppm}^{472}(1 \mathrm{H}, \mathrm{m}$, 507-CHOH) and $3.45-3.33 \mathrm{ppm}^{473}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 6}-\mathrm{CHHOH})$ in the ${ }^{1} \mathrm{H}$ NMR spectrum provided a ratio of $\mathbf{5 0 6}: \mathbf{5 0 7}=\mathbf{7 0}: 30$. No further data were obtained for this crude mixture.

## 2-Methylheptan-1-ol 506b

The reaction was carried out according to General Procedure 3 (using $0.385 \mathrm{~g}, 1.65$ mmol 1,1,1-trichloro-2-methylheptan-2-ol 505b) to yield crude product as a colourless oil ( $0.147 \mathrm{~g}, 69 \%)$. Integration of the peaks at $3.88-3.73 \mathrm{ppm}^{474}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$ and 3.47-3.36 $\mathrm{ppm}^{475}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 6}-\mathrm{CHHOH})$ in the ${ }^{1} \mathrm{H}$ NMR spectrum provided a ratio of $\mathbf{5 0 6}: 507=82: 18$. No further data were obtained for this crude mixture.

## 2-Methylnonan-1-ol 506c

The reaction was carried out according to General Procedure 3 (using 0.270 g, 1.03 mmol 1,1,1-trichloro-2-methylnonan-2-ol 505c) to yield crude product as a colourless oil ( $97 \mathrm{mg}, 65 \%$ ). Integration of the peaks at $3.86-3.72 \mathrm{ppm}^{476}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$ and 3.46-3.36 ppm $(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 6}-\mathrm{C} H \mathrm{HOH})$ in the ${ }^{1} \mathrm{H}$ NMR spectrum provided a ratio of $\mathbf{5 0 6}: \mathbf{5 0 7}=77: 23$. No further data were obtained for this crude mixture.

## 2-Methyldecan-1-ol 506d

The reaction was carried out according to General Procedure 4 (using 0.140 g, 0.51 mmol 1,1,1-trichloro-2-methyldecan-2-ol 505d) to yield crude product as a colourless oil ( $73.0 \mathrm{mg}, 90 \%$ ). Integration of the peaks at $3.86-3.75 \mathrm{ppm}^{477}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$
and 3.46-3.36 $\mathrm{ppm}^{478}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 6}-\mathrm{C} H \mathrm{HOH})$ in the ${ }^{1} \mathrm{H}$ NMR spectrum provided a ratio of $\mathbf{5 0 6}: 5 \mathbf{5 0}=82: 18$. No further data were obtained for this crude mixture.

## 2-Butylhexan-1-ol 506e

The reaction was carried out according to General Procedure 3 (using 0.266 g, 1.02 mmol 5-(trichloromethyl)nonan-5-ol 505e) to yield crude product as a colourless oil $(0.143 \mathrm{~g}, 90 \%)$. Integration of the peaks at $3.62-3.55 \mathrm{ppm}^{479}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$ and $3.53 \mathrm{ppm}^{480}\left(2 \mathrm{H}, \mathrm{d}, J 5.5, \mathbf{5 0 6}-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided an approximate ratio of $\mathbf{5 0 6}: \mathbf{5 0 7}=$ 45:55 as the peaks were slightly overlapping. No further data were obtained for this crude mixture.

## Cyclopentylmethanol 506f

The reaction was carried out according to General Procedure 3 (using $98.0 \mathrm{mg}, 0.484$ mmol 1-(trichloromethyl)cyclopentan-1-ol 505f) to yield crude product as a colourless oil ( $32.0 \mathrm{mg}, 70 \%$ ). Integration of the peaks at $4.37-4.30 \mathrm{ppm}^{472}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$ and $3.51 \mathrm{ppm}^{481}\left(2 \mathrm{H}, \mathrm{d}, J 7, \mathbf{5 0 6}-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided a ratio of $\mathbf{5 0 6 : 5 0 7}=95: 5$. No further data were obtained for this crude mixture.

## Cyclohexylmethanol 506g

The reaction was carried out according to General Procedure 3 (using 0.190 g, 0.880 mmol 1-(trichloromethyl)cyclohexan-1-ol 505g) to yield crude product as a colourless oil ( $85.0 \mathrm{mg}, 76 \%$ ). Integration of the relevant peaks at $3.67-3.54 \mathrm{ppm}^{482}(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-$ $\mathrm{CHOH})$ and $3.44 \mathrm{ppm}^{483}\left(2 \mathrm{H}, \mathrm{d}, \mathrm{J} 6, \mathbf{5 0 6}-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided a ratio of 506:507 $=73: 17$. No further data were obtained for this crude mixture.

## Cyclooctylmethanol 506h

The reaction was carried out according to General Procedure 3 (using $0.240 \mathrm{~g}, 0.980$ mmol 1-(trichloromethyl)cyclooctan-1-ol 505h) to yield crude product as a colourless oil $(0.115 \mathrm{~g}, 82 \%)$. Integration of the relevant peaks at $3.85 \mathrm{ppm}^{484}(1 \mathrm{H}, \mathrm{tt}, J 8.5,4$, $\mathbf{5 0 7}-\mathrm{CHOH})$ and $3.44-3.34^{478}\left(2 \mathrm{H}, \mathrm{m}, \mathbf{5 0 6}-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided a ratio of $\mathbf{5 0 6}: \mathbf{5 0 7}=$ 21:79. No further data were obtained for this crude mixture.

## Cyclododecylmethanol 506i

The reaction was carried out according to General Procedure 3 (using $0.342 \mathrm{~g}, 1.14$ mmol 1-(trichloromethyl)cyclododecan-1-ol 505i) to yield crude product as a colourless oil ( $0.214 \mathrm{~g}, 95 \%$ ). Integration of the relevant peaks at 3.90-3.79 $\mathrm{ppm}^{485}$ $(1 \mathrm{H}, \mathrm{m}, \mathbf{5 0 7}-\mathrm{CHOH})$ and $3.49 \mathrm{ppm}^{486}\left(2 \mathrm{H}, \mathrm{d}, J 6, \mathbf{5 0 6}-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided a ratio of 506:507 $=66: 34$. The primary alcohol $\mathbf{5 0 6 i}$ could be separated cleanly $(0.110 \mathrm{~g}, 49 \%)$ by column chromatography (8:2 petroleum ether/EtOAc). v ( $\mathrm{cm}^{-1}$ ); 3329 (br, O-H stretch), 2926 (C-H stretch), 1039 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.49$ (2H, d, J 6.5, $\left.\mathrm{CH}_{2} \mathrm{OH}\right), 1.69-1.62\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2} \mathrm{OH}\right), 1.47-1.22\left(22 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 67.2\left(\mathrm{CH}_{2} \mathrm{OH}\right), 36.9\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 26.4,24.5,23.8,23.6$, 23.7, $22.2\left(\mathrm{CH}_{2}\right)$; GC/MS (EI): $180.6\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{486}$

## General preparation of lithium diisopropylamide (LDA)

A 1M solution of LDA could be prepared using the following procedure. A solution of diisopropylamine $(0.16 \mathrm{~mL}, 1.1 \mathrm{mmol})$ in THF $(0.44 \mathrm{~mL})$ was placed under nitrogen and cooled to $-78{ }^{\circ} \mathrm{C} . n-\mathrm{BuLi}(0.40 \mathrm{~mL}, 2.5 \mathrm{M}$ in THF, 1.00 mmol$)$ was then added and the solution was stirred at $-78^{\circ} \mathrm{C}$ for 30 minutes. After this time the LDA was used in the reactions shown below.

## Dichloromethyllithium Addition: General Procedure 4

To a solution of ketone (1.0 equiv.) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL} / \mathrm{mmol}$ ketone) was added freshly prepared LDA ( 2.0 equiv., 1 M in THF) at $-78^{\circ} \mathrm{C}$, under nitrogen. The reaction was stirred for 30 minutes at this temperature unless specified otherwise, then quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) ( 3 mL ). The product was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the combined organic fractions were washed successively with pH 2 buffer and water, then dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo and the crude product was purified by column chromatography where necessary.

## 1,1-Dichloro-2-methylheptan-2-ol 542a

The compound was prepared according to General Procedure 4 (using $0.140 \mathrm{~mL}, 1.00$ mmol 2-heptanone 541a) to yield product as a yellow oil ( $0.176 \mathrm{~g}, 88 \%$ ). v $\left(\mathrm{cm}^{-1}\right)$; 3437 (br, O-H stretch), 2955 (C-H stretch), 1155 (C-O stretch), 772 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.68\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 2.04(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.77-1.63(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.45-1.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.38\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, 1.37-1.24 $\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.90\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J} 7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 81.0\left(\mathrm{CHCl}_{2}\right)$, $76.6(\mathrm{C}(\mathrm{OH})), 37.5\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 32.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 23.0,22.7\left(\mathrm{CH}_{2}\right), 22.1\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, $14.1\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): 163.2, $165.2[\mathrm{M}-\mathrm{Cl}]^{+}, 145.1,147.1\left[\mathrm{M}-\mathrm{ClH}_{2} \mathrm{O}\right]^{+}, 127.1$ $\left[\mathrm{M}_{\left.-\mathrm{Cl}_{2}\right]^{+}, 109.2\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+} .}\right.$.

## 1,1-Dichloro-2-methylnonan-2-ol 542b

The compound was prepared according to General Procedure 4 (using $0.170 \mathrm{~mL}, 1.00$ mmol 2-nonanone 541b) to yield product as a colourless oil ( $0.206 \mathrm{~g}, 91 \%$ ). $v\left(\mathrm{~cm}^{-1}\right)$; 3400 (br, O-H stretch), 2925 (C-H stretch), 1145 (C-O stretch), 772 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.68\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 2.05(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.77-1.63(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.44-1.37\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.35-1.23$ $\left(8 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J} 7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 81.0\left(\mathrm{CHCl}_{2}\right)$, $76.5(\mathrm{C}(\mathrm{OH})), 37.5\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 31.9\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 30.1,29.3,23.3,22.8\left(\mathrm{CH}_{2}\right), 22.1$ $\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), \quad 14.2 \quad\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \quad \mathrm{GC} / \mathrm{MS} \quad(\mathrm{EI}): \quad 191.1, \quad 193.1 \quad[\mathrm{M}-\mathrm{Cl}]^{+}, \quad 137.1$ $\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$.

## 1,1-Dichloro-2-methyldecan-2-ol 542c

The compound was prepared according to General Procedure 4 (using $0.190 \mathrm{~mL}, 1.00$ mmol 2-decanone 541c) to yield product as a colourless oil ( $0.226 \mathrm{~g}, 94 \%$ ). $v\left(\mathrm{~cm}^{-1}\right)$; 3437 (br, O-H stretch), 2924 (C-H stretch), 1143 (C-O stretch), 773 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.68\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 2.04(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.77-1.63(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.44-1.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.38\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.35-1.22$ $\left(12 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 81.0$ $\left(\mathrm{CHCl}_{2}\right), 76.6(\mathrm{C}(\mathrm{OH})), 37.5\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 32.0\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right), 30.1,29.6,29.4,23.3,22.8$ $\left(\mathrm{CH}_{2}\right)$, $22.1\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$, $14.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 205.1,207.1[\mathrm{M}-\mathrm{Cl}]^{+}, 169.1$ $\left[\mathrm{M}-\mathrm{Cl}_{2}\right]^{+}, 151\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$.

## 1,1-Dichloro-2,3,3-trimethylbutan-2-ol 542d

The compound was prepared according to General Procedure 4 (using $0.120 \mathrm{~mL}, 1.00$ mmol 3,3-dimethylbutan-2-one 541d) to yield product as a colourless oil ( 60.7 mg , $33 \%$ ) after column chromatography ( $100 \%$ petroleum ether to $95: 5$ petroleum ether/Et 2 O). $v\left(\mathrm{~cm}^{-1}\right) ; 3585$ (br, O-H stretch), 2959 (C-H stretch), 1110 (C-O stretch), 787 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.97\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 2.11-2.06(1 \mathrm{H}$, $\mathrm{m}, \mathrm{OH}), 1.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC}\left(\mathrm{CH}_{3}\right)\right), 1.10\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right)$ $\delta 79.8\left(\mathrm{CHCl}_{2}\right), 79.3(\mathrm{C}(\mathrm{OH})), 38.3\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 26.9\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 17.3\left(\mathrm{OC}\left(\mathrm{CH}_{3}\right)\right)$; GC/MS (EI): 149.2, $150.9[\mathrm{M}-\mathrm{Cl}]^{+}, 131.0,133.0\left[\mathrm{M}-\mathrm{ClH}_{2} \mathrm{O}\right]^{+}, 113.1\left[\mathrm{M}_{\left.-\mathrm{Cl}_{2}\right]^{+}, ~}^{1} 25.2\right.$ $\left[\mathrm{M}-\mathrm{Cl}_{2} \mathrm{H}_{2} \mathrm{O}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{487}$

## 1-(Dichloromethyl)cyclohexan-1-ol 542e

The compound was prepared according to General Procedure 4 (using $0.100 \mathrm{~mL}, 1.00$ mmol cyclohexanone 541e) to yield product as a colourless oil ( $0.113 \mathrm{~g}, 62 \%$ ) after column chromatography (9:1 petroleum ether/Et $\mathrm{t}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3428$ (br, O-H stretch), 2934 (C-H stretch), 1150 (C-O stretch), 751 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$ $\mathrm{MHz}) \delta 5.62\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 1.89(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.82-1.73(2 \mathrm{H}, \mathrm{m}, \mathrm{CHHC}(\mathrm{OH})), 1.71-$ $1.58\left(7 \mathrm{H}, \mathrm{m}, \mathrm{CHHC}(\mathrm{OH})\right.$ and $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})$ and $\left.\mathrm{CHHCH} 2 \mathrm{CH}_{2}\right), 1.24-1.14(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCH} 2 \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 81.9\left(\mathrm{CHCl}_{2}\right), 75.2(\mathrm{C}(\mathrm{OH})), 32.7$ $\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$, $25.5\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, $21.6\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right)$; GC/MS (EI): 147.1, 149.1

## 1,1-Dichloro-2-cyclohexylpropan-2-ol 5421

The compound was prepared according to General Procedure 4 (using $0.140 \mathrm{~mL}, 1.00$ mmol 1-cyclohexylethan-1-one 5411) to yield product as a colourless oil ( 0.166 g , $79 \%$ ) after column chromatography (9:1 petroleum ether/ $\mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3468$ (br, OH stretch), 2929 (C-H stretch), 1067 (C-O stretch), 757 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 5.85\left(\mathrm{CHCl}_{2}\right), 1.93(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 1.88-1.74\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}\right.$ and $\left.\mathrm{CH}_{2}\right)$, 1.73-1.64(2H, m, CH2), $1.32\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 1.30-1.07\left(5 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $125 \mathrm{MHz}) \delta 80.3\left(\mathrm{CHCl}_{2}\right), 77.9(\mathrm{C}(\mathrm{OH})), 44.2(\mathrm{CHC}(\mathrm{OH})), 27.5,26.6,26.5,26.4$ $\left(\mathrm{CH}_{2}\right), 19.5\left(\mathrm{CH}_{3}\right)$, one carbon missing due to overlapping peaks; GC/MS (EI): 211.2, $213.1[\mathrm{M}+\mathrm{H}]^{+}, 192.0,194.1\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 157.2,159.2\left[\mathrm{M}-\mathrm{ClH}_{2} \mathrm{O}\right]^{+}$.
(5R)-1-(Dichloromethyl)-5-methyl-2-(propan-2-ylidene)cyclohexan-1-ol 542n

The compound was prepared according to General Procedure 4 (using $0.160 \mathrm{~mL}, 1.00$ $\mathrm{mmol}(R)$-pulegone 541 n$)$ to yield product as a yellow oil ( $0.162 \mathrm{~g}, 69 \%$ ) after column
chromatography to separate the 13.3:1 mixture of diastereoisomers ( $95: 5$ petroleum ether/Et ${ }_{2} \mathrm{O}$ ). v ( $\mathrm{cm}^{-1}$ ); 3569 (br, O-H stretch), 2952 (C-H stretch), 777 (C-Cl stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 6.22\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}_{2}\right), 2.82-2.74\left(1 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HCH}_{2}\right), 2.29$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 2.19-2.13(1 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HC}(\mathrm{OH})), 2.08\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)\right), 1.78-1.71(1 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{CHHCHCH}_{3}\right), 1.74\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)\right), 1.70-1.57\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}, \mathrm{CHHCH}_{2}\right), 1.35$ $(1 \mathrm{H}, \mathrm{t}, J 13, \mathrm{CHHC}(\mathrm{OH})), 0.99-0.88\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH} H \mathrm{CHCH}_{3}\right), 0.92(3 \mathrm{H}, \mathrm{d}, J 6.5$, $\left.\mathrm{CH}_{3} \mathrm{CH}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 130.3\left(\mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right), 128.3\left(\mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $81.2(\mathrm{C}(\mathrm{OH})), 79.7\left(\mathrm{CHCl}_{2}\right), 47.6\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 35.0\left(\mathrm{CH}_{2} \mathrm{CHCH}_{3}\right), 30.0\left(\mathrm{CHCH}_{3}\right)$, $29.0\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right), 24.3,22.6\left(\mathrm{C}=\mathrm{C}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $22.1\left(\mathrm{CHCH}_{3}\right)$; $\mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 236.4[\mathrm{M}]^{+}$, $165.2\left[\mathrm{M}-\mathrm{Cl}_{2}\right]^{+}$. Data shown is for the major diastereoisomer only, the minor diastereoisomer could not be isolated cleanly. The configuration of the $\mathrm{C}-1$ centre is not known.

## Jocic Reaction: General Procedure 5

To a solution of dichloromethylcarbinol (1.00 equiv.) in dry propan-2-ol ( $4 \mathrm{~mL} / \mathrm{mmol}$ substrate) was added $\mathrm{LiBH}_{4}$ (4.00 equiv.) and NaOH ( 3.00 equiv.) under nitrogen, and stirred for 16 hours at room temperature. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) and brine was added. The product was extracted with EtOAc ( $5 \times 10 \mathrm{~mL}$ ), the combined organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (petroleum ether/EtOAc).

## 2-Methylheptan-1-ol 543a

The compound was prepared according to General Procedure 5 (using $0.109 \mathrm{~g}, 0.548$ mmol 1,1-dichloro-2-methylheptan-2-ol 542a) to yield product as a colourless oil (21 $\mathrm{mg}, 30 \%)$ after column chromatography ( $7: 3$ petroleum ether/ $/ \mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3347$ (br, O-H stretch), 2925 (C-H stretch), 1032 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 3.54-3.39\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OH}\right), 1.65-1.55\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 1.44-1.21(7 \mathrm{H}, \mathrm{m}$, $\mathrm{CHHCHCH}_{3}$ and $\left.\mathrm{CH}_{2}\right), 1.15-1.05\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCHCH}_{3}\right), 0.91\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.5, \mathrm{CHCH}_{3}\right)$, $0.89\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 68.6\left(\mathrm{CH}_{2} \mathrm{OH}\right), 35.9$ $\left(\mathrm{CHCH}_{3}\right)$, $33.2\left(\mathrm{CH}_{2} \mathrm{CHCH}_{3}\right), 32.3,26.8,22.8\left(\mathrm{CH}_{2}\right), 16.8\left(\mathrm{CHCH}_{3}\right)$, $14.2\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): $111.7\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 97.1\left[\mathrm{C}_{7} \mathrm{H}_{14}\right]^{+}, 83.1\left[\mathrm{C}_{6} \mathrm{H}_{12}\right]^{+}, 69.2\left[\mathrm{C}_{5} \mathrm{H}_{10}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{475}$

## 2-Methylnonan-1-ol 543b

The compound was prepared according to General Procedure 5 (using 0.148 g, 0.655 mmol 1,1-dichloro-2-methylnonan-2-ol 542b) to yield product as a colourless oil (72.0 $\mathrm{mg}, 75 \%$ ) after column chromatography ( $7: 3$ petroleum ether/Et $\mathrm{E}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3315$ (br, O-H stretch), 2922 (C-H stretch), 1036 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 3.51$ (1H, dd, $J 10.5,5.5, \mathrm{C} H \mathrm{HOH}), 3.42(1 \mathrm{H}, \mathrm{dd}, J 10.5,6.5, \mathrm{CHHOH}), 1.65-1.51$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 1.53-1.43\left(11 \mathrm{H}, \mathrm{m}, \mathrm{CHHCHCH} 3\right.$ and $\left.\mathrm{CH}_{2}\right), 1.15-1.03(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCHCH}_{3}\right), 0.91\left(3 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CHCH}_{3}\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 68.6\left(\mathrm{CH}_{2} \mathrm{OH}\right), 35.9\left(\mathrm{CHCH}_{3}\right), 33.3\left(\mathrm{CH}_{2} \mathrm{CHCH}_{3}\right), 32.0,30.1$,
29.5, 27.2, $22.8\left(\mathrm{CH}_{2}\right), 16.7\left(\mathrm{CHCH}_{3}\right), 14.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 158.2[\mathrm{M}]^{+}$, $140.2\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{489}$

## 2-Methyldecan-1-ol 543c

The compound was prepared according to General Procedure 5 (using $0.121 \mathrm{~g}, 0.502$ mmol 1,1-dichloro-2-methyldecan-2-ol 542c) to yield product as a colourless oil (58.0 $\mathrm{mg}, 66 \%$ ) after column chromatography ( $7: 3$ petroleum ether/Et $\mathrm{I}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3328$ (br, O-H stretch), 2921 (C-H stretch), 1036 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 3.51(1 \mathrm{H}, \mathrm{dd}, J 10.5,6, \mathrm{CHHOH}), 3.41(1 \mathrm{H}, \mathrm{dd}, J 10.5,6.5, \mathrm{CHHOH}), 1.65-1.54$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 1.43-1.15\left(13 \mathrm{H}, \mathrm{m}, \mathrm{CHHCHCH} \mathrm{H}_{3}\right.$ and $\left.\mathrm{CH}_{2}\right), 1.14-1.05(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CHHCHCH}_{3}\right), 0.91\left(3 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CHCH}_{3}\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 68.6\left(\mathrm{CH}_{2} \mathrm{OH}\right), 35.9\left(\mathrm{CHCH}_{3}\right), 33.3\left(\mathrm{CH}_{2} \mathrm{CHCH}_{3}\right), 32.0,30.1$, 29.8, 29.5, 27.1, $22.8\left(\mathrm{CH}_{2}\right), 16.7\left(\mathrm{CHCH}_{3}\right), 14.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): 154.3 [M$\left.\mathrm{H}_{2} \mathrm{O}\right]^{+}, 125.0\left[\mathrm{C}_{9} \mathrm{H}_{18}\right]^{+}, 112.0\left[\mathrm{C}_{8} \mathrm{H}_{16}\right]^{+}, 98.0\left[\mathrm{C}_{7} \mathrm{H}_{14}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{490}$

## Cyclohexylmethanol 543e

The compound was prepared according to General Procedure 5 (using $98.0 \mathrm{mg}, 0.536$ mmol 1-(dichloromethyl)cyclohexan-1-ol 542e) to yield product as a colourless oil ( $19.0 \mathrm{mg}, 31 \%$ ) after column chromatography ( $6: 4$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right)$; 3330 (br, O-H stretch), 2919 (C-H stretch), 1023 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$
$\mathrm{MHz}) \delta 3.44\left(2 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CH}_{2} \mathrm{OH}\right), 1.79-1.71(4 \mathrm{H}, \mathrm{m}, \mathrm{CHHCHCH} 2 \mathrm{OH}$ and $\left.\mathrm{CHHCH}_{2} \mathrm{CH}\right), 1.70-1.64\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHCH}_{2} \mathrm{CH}_{2}\right), 1.53-1.42\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2} \mathrm{OH}\right)$, 1.31-1.11 $\left(3 \mathrm{H}, \quad \mathrm{m}, \quad \mathrm{CHHCH} 2 \mathrm{CH}\right.$ and $\left.\mathrm{CHHCH} \mathrm{CH}_{2}\right), \quad 0.98-0.88(2 \mathrm{H}, \quad \mathrm{m}$, $\mathrm{CHHCHCH} 2 \mathrm{OH}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 69.0\left(\mathrm{CH}_{2} \mathrm{OH}\right), 40.6(\mathrm{CH}), 30.0$ $\left(\mathrm{CH}_{2} \mathrm{CH}\right), 26.7\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right), 26.0\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right)$; $\mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 96.1\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$, $83.2\left[\mathrm{C}_{6} \mathrm{H}_{11}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{491}$

## Cyclooctylmethanol 543f

The reaction was carried out according to General Procedure 5 (using $0.103 \mathrm{~g}, 0.489$ mmol 1-(dichloromethyl)cyclooctan-1-ol 524f) to yield a mixture of $\mathbf{5 4 3 f}$ and $\mathbf{5 4 8}$ as a colourless oil ( 63.0 mg ). Peaks at $5.68-5.55 \mathrm{ppm}\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CH}_{2}\right), 4.04 \mathrm{ppm}(2 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{2} \mathrm{OH}\right)$ and $2.24-2.02 \mathrm{ppm}\left(4 \mathrm{H}, \mathrm{m}\right.$, allylic) in the crude ${ }^{1} \mathrm{H}$ NMR spectrum suggest the presence of $\mathbf{5 4 8}$ by comparison to the literature. ${ }^{492}$

## Cyclododecylmethanol 543g

The reaction was carried out according to General Procedure 5 (using $0.138 \mathrm{~g}, 0.517$ mmol 1-(dichloromethyl)cyclododecan-1-ol 542g) to yield a crude mixture as a colourless oil ( $90.0 \mathrm{mg}, 88 \%$ ). Integration of the relevant peaks at $3.90-3.79 \mathrm{ppm}^{485}$ $(1 \mathrm{H}, \mathrm{m}, \mathbf{5 4 4}-\mathrm{CHOH})$ and $3.49 \mathrm{ppm}^{486}\left(2 \mathrm{H}, \mathrm{d}, J 6,543-\mathrm{CH}_{2} \mathrm{OH}\right)$ provided a ratio of 543:544 $=96: 4$. Compound $\mathbf{5 4 3} \mathrm{g}$ could be isolated as a colourless oil ( $57.6 \mathrm{mg}, 56 \%$ )
after column chromatography ( $7: 3$ petroleum ether/Et 2 O ), and was fully characterised previously.

## 2-Butylhexan-1-ol 543 h

The compound was prepared according to General Procedure 5 (using $0.111 \mathrm{~g}, 0.491$ mmol 5-(dichloromethyl)decan-5-ol 542h) to yield product as a colourless oil (50.0 $\mathrm{mg}, 65 \%$ ) after column chromatography ( $7: 3$ petroleum ether/ $\mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3328$ (br, O-H stretch), 2924 (C-H stretch), 1043 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ $\delta 3.54\left(2 \mathrm{H}, \mathrm{d}, J 5.5, \mathrm{CH}_{2} \mathrm{OH}\right), 1.49-1.41\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2} \mathrm{OH}\right), 1.38-1.22(12 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.18(1 \mathrm{H}, \mathrm{br}$ s, OH$), 0.90\left(6 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta$ $65.9\left(\mathrm{CH}_{2} \mathrm{OH}\right), 40.7\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 30.8,29.3,23.3\left(\mathrm{CH}_{2}\right), 14.2\left(\mathrm{CH}_{3}\right)$; GC/MS (EI): $158.0 \mathrm{M}^{+}, 140.2\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 112.1\left[\mathrm{C}_{8} \mathrm{H}_{16}\right]^{+}, 98.0\left[\mathrm{C}_{7} \mathrm{H}_{14}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{480}$
cis-4-(tert-Butyl)cyclohexyl)methanol 543i

The compound was prepared according to General Procedure 4 (using $0.150 \mathrm{~g}, 0.628$ mmol cis-4-(tert-butyl)-1-(dichloromethyl)cyclohexan-1-ol 542i) to yield product as a white solid ( $61.0 \mathrm{mg}, 26 \%$ ) after column chromatography (8:2 petroleum ether/Et ${ }_{2} \mathrm{O}$ ). v ( $\mathrm{cm}^{-1}$ ); 3248 (br, O-H stretch), 2932 (C-H stretch), 1031 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.67-3.61\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OH}\right), 1.87-1.76(3 \mathrm{H}, \mathrm{m}$, $\mathrm{CHCH}_{2} \mathrm{OH}$ and CHHCHCH 2 OH$), 1.57-1.51\left(2 \mathrm{H}, \mathrm{m}, \mathrm{C} H \mathrm{HCHC}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.50-1.41$
$(2 \mathrm{H}, \mathrm{m}, \mathrm{CHHCHCH} 2 \mathrm{OH}), 1.19-1.15(1 \mathrm{H}, \mathrm{m}, \mathrm{OH}), 1.10-0.94\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CHC}\left(\mathrm{CH}_{3}\right)_{3}\right.$ and $\left.\mathrm{CHHCHC}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.83\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 63.9$ $\left(\mathrm{CH}_{2} \mathrm{OH}\right), 48.5\left(\mathrm{CHC}\left(\mathrm{CH}_{3}\right)_{3}\right)$, $35.5\left(\mathrm{CHCH}_{2} \mathrm{OH}\right)$, $32.7\left(C\left(\mathrm{CH}_{3}\right)_{3}\right)$, $27.60\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right)$, $27.59\left(\mathrm{CH}_{2} \mathrm{CHCH}_{2} \mathrm{OH}\right), 22.2\left(\mathrm{CH}_{2} \mathrm{CHC}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 170.3[\mathrm{M}]^{+} ; \mathrm{m} . \mathrm{p}=62-$ $63^{\circ} \mathrm{C}$. Spectroscopic data are consistent with that previously reported. ${ }^{461,462}$
trans-4-(tert-Butyl)cyclohexyl)methanol 543i

The compound was prepared according to General Procedure 4 (using $94.0 \mathrm{mg}, 0.393$ mmol trans-4-(tert-butyl)-1-(dichloromethyl)cyclohexan-1-ol 542i) to yield product as a colourless oil ( $19.0 \mathrm{mg}, 29 \%$ ) after column chromatography ( $6: 4$ petroleum ether/Et 2 O ). $v\left(\mathrm{~cm}^{-1}\right) ; 3324$ (br, O-H stretch), 2938 (C-H stretch), 1033 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.44\left(2 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{CH}_{2} \mathrm{OH}\right), 1.87-1.76\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, 1.45-1.27 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2} \mathrm{OH}\right), 1.27(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 1.04-0.88\left(5 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right.$ and $\left.\mathrm{CHC}\left(\mathrm{CH}_{3}\right)_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 67.0\left(\mathrm{CH}_{2} \mathrm{OH}\right)$, $48.4\left(\mathrm{CHC}\left(\mathrm{CH}_{3}\right)_{3}\right), 40.7\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 32.4\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 30.1\left(\mathrm{CH}_{2}\right), 27.7\left(\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right)$, $26.9\left(\mathrm{CH}_{2}\right)$; GC/MS (EI): $152.1\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 113.1\left[\mathrm{C}_{7} \mathrm{H}_{13}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{461,462}$
( $\pm$ )-cis-2-Methylcyclohexyl)methanol 543j

The compound was prepared according to General Procedure 4 (using $93.6 \mathrm{mg}, 0.475$ mmol 1-(dichloromethyl)-2-methylcyclohexan-1-ol $\mathbf{5 4 2 j}$, 5.8:1 ratio of diastereoisomers) to yield product as a colourless oil ( $36.0 \mathrm{mg}, 59 \%$ ) after column chromatography to separate the $33: 1$ ratio of diastereoisomers (1:1 petroleum ether/Et 2 O). $v\left(\mathrm{~cm}^{-1}\right) ; 3313$ (br, O-H stretch), 2920 (C-H stretch), 1030 (C-O stretch); ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ 8 3.57-3.44 (2H, m, $\left.\mathrm{CH}_{2} \mathrm{OH}\right), 2.00-1.91\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right)$, 1.73-1.66(1H, m, CHCH $\left.\mathrm{CH}_{2} \mathrm{OH}\right), 1.65-1.12\left(8 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 0.86\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 65.3\left(\mathrm{CH}_{2} \mathrm{OH}\right), 42.9\left(\mathrm{CHCH}_{3}\right), 32.8\left(\mathrm{CH}_{2}\right), 30.0$ $\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 25.1,24.5,22.0\left(\mathrm{CH}_{2}\right), 13.9\left(\mathrm{CH}_{3}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 128.2[\mathrm{M}]^{+}, 110.1[\mathrm{M}-$ $\left.\mathrm{H}_{2} \mathrm{O}\right]^{+}, 97.2\left[\mathrm{C}_{7} \mathrm{H}_{13}\right]^{+}, 82.2\left[\mathrm{C}_{6} \mathrm{H}_{10}\right]^{+}$. This compound was previously reported in the literature without ${ }^{1} \mathrm{H}$ or ${ }^{13} \mathrm{C}$ NMR data. ${ }^{493}$

## ( $\pm$ )-cis-[1,1'-bi(Cyclohexan)]-2-yl)methanol 543k

The compound was prepared according to General Procedure 4 (using $0.145 \mathrm{~g}, 0.547$ mmol cis-2-(dichloromethyl)-[1,1'-bi(cyclohexan)]-2-ol 542k) to yield product as a white solid ( $42.0 \mathrm{mg}, 39 \%$ ) after column chromatography ( $7: 3$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right) ; 3322$ (br, O-H stretch), 2915 (C-H stretch), 1027 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 3.76-3.69\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OH}\right), 2.08-2.00\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2} \mathrm{OH}\right)$, 1.99-0.70 (20H, m, $\mathrm{CH}_{2}$ and CH$) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 59.9\left(\mathrm{CH}_{2} \mathrm{OH}\right), 45.4$
(CH), 39.2 (CH), $37.4\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 31.6,30.8,27.6,27.0,26.8,26.65,26.63,25.5$, $20.8\left(\mathrm{CH}_{2}\right)$; GC/MS (EI): $178.2\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 165.2\left[\mathrm{C}_{12} \mathrm{H}_{22}\right]^{+} ;$m.p $=56-57{ }^{\circ} \mathrm{C}$. This compound was previously reported without ${ }^{1} \mathrm{H}$ or ${ }^{13} \mathrm{C}$ NMR data. ${ }^{463}$

## 2-Cyclohexylpropan-1-ol 5431

The compound was prepared according to General Procedure 4 (using $96.0 \mathrm{mg}, 0.455$ mmol 1,1-dichloro-2-cyclohexylpropan-2-ol 542I) to yield product as a colourless oil ( $30.0 \mathrm{mg}, 46 \%$ ) after column chromatography ( $7: 3$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$ ). $v\left(\mathrm{~cm}^{-1}\right)$; 3345 (br, O-H stretch), 2921 (C-H stretch), 1018 (C-O stretch); ${ }^{1}{ }^{H}$ NMR ( $\mathrm{CDCl}_{3}, 500$ MHz) $\delta 3.65-3.58(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHOH}), 3.50-3.43(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHOH}), 1.78-1.60(5 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.54-1.44\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 1.38-1.29\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCHCH}_{3}\right), 1.27-0.93(5 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 0.89\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 7, \mathrm{CHCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 66.5\left(\mathrm{CH}_{2} \mathrm{OH}\right), 41.1$ $\left(\mathrm{CHCH}_{2} \mathrm{OH}\right), 39.5\left(\mathrm{CHCHCH}_{3}\right), 31.1,29.0,26.90,26.85,26.80\left(\mathrm{CH}_{2}\right), 13.5\left(\mathrm{CH}_{3}\right)$; GC/MS (EI): $124.3\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{494}$

## 2-Methylnonan-2-ol 549

To a solution of 2-decanone 541c ( $0.380 \mathrm{~mL}, 2.00 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{~mL})$ was added methylmagnesium bromide ( $2.00 \mathrm{~mL}, 3 \mathrm{M}$ in THF, 6.00 mmol ) dropwise, at 0 ${ }^{\circ} \mathrm{C}$. The mixture was heated at reflux temperature for two hours, then cooled to $0^{\circ} \mathrm{C}$ and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.). The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$, washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The
compound was a colourless oil ( $0.309 \mathrm{~g}, 90 \%$ ) and was used without further purification. $v\left(\mathrm{~cm}^{-1}\right) ; 3361$ (br, O-H stretch), 2925 (C-H stretch), 1150 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta$ 1.48-1.43 (2H, m, $\left.\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 1.37-1.23(12 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.21\left(6 \mathrm{H}, \mathrm{s},\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}(\mathrm{OH})\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125\right.$ $\mathrm{MHz}) \delta 71.2(\mathrm{C}(\mathrm{OH})), 44.2\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{OH})\right), 32.0,30.3,29.8,29.4\left(\mathrm{CH}_{2}\right), 29.3$ $\left(\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}(\mathrm{OH})\right), 24.5,22.8\left(\mathrm{CH}_{2}\right), 14.3\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right) ; \mathrm{GC} / \mathrm{MS}(\mathrm{EI}): 173.1[\mathrm{M}+\mathrm{H}]^{+}, 157.1$ $\left[\mathrm{C}_{10} \mathrm{H}_{21} \mathrm{O}\right]^{+}, 153.9\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{495}$

## 2-Heptyl-2-methyloxirane 550

A round-bottomed flask was charged with NaH ( $60 \%$ dispersion in mineral oil, 0.40 $\mathrm{g}, 10 \mathrm{mmol}$ ), and the NaH was washed with petroleum ether. Trimethylsulfoxonium iodide ( $2.2 \mathrm{~g}, 10 \mathrm{mmol}$ ) was then added, followed by DMSO ( 5 mL ), at $0^{\circ} \mathrm{C}$. The mixture was stirred for 20 minutes at room temperature, then a solution of 2-decanone 541c ( $0.95 \mathrm{~mL}, 5.0 \mathrm{mmol}$ ) in DMSO ( 5 mL ) was added. The reaction was stirred at room temperature for a further 22 hours then cooled to $0^{\circ} \mathrm{C}$ and water was added. The mixture was extracted with $1: 1$ petroleum ether $/ \mathrm{Et}_{2} \mathrm{O}$, the combined organic fractions were washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The compound was a colourless oil ( $0.62 \mathrm{~g}, 73 \%$ ) and was used without further purification. $v\left(\mathrm{~cm}^{-1}\right) ; 2923$ (C-H stretch), 901, 798 (C-O stretch); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $500 \mathrm{MHz}) \delta 2.60(1 \mathrm{H}, \mathrm{d}, J 5, \mathrm{CHHO}), 2.57(1 \mathrm{H}, \mathrm{d}, J 5, \mathrm{CHHO}), 1.62-1.55(1 \mathrm{H}, \mathrm{m}$, $\mathrm{CHHC}(\mathrm{O})$ ), 1.51-1.44 (1H, m, $\mathrm{CHHC}(\mathrm{O})), 1.42-1.34\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{O})\right.$ ), 1.32$1.19\left(10 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{C}(\mathrm{O})\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta 57.2(\mathrm{CO}), 54.1\left(\mathrm{CH}_{2} \mathrm{O}\right), 36.9\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{O})\right), 32.0,29.8,29.7,29.4$
$\left(\mathrm{CH}_{2}\right)$, $25.4\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{O})\right)$, $22.8\left(\mathrm{CH}_{2}\right)$, $21.0\left(\mathrm{CH}_{3} \mathrm{C}(\mathrm{O})\right)$, $14.2\left(\mathrm{CH}_{3} \mathrm{CH}_{2}\right)$; GC/MS (EI): $170.2[\mathrm{M}]^{+}$. Spectroscopic data are consistent with that previously reported. ${ }^{496}$

## 2-(4-Methoxyphenoxy)-2-methyldecanal 553

To a solution of 1,1-dichloro-2-methyldecan-2-ol $\mathbf{5 4 2 c}(0.241 \mathrm{~g}, 1.00 \mathrm{mmol})$ and 4methoxyphenol ( $0.472 \mathrm{~g}, 3.00 \mathrm{mmol}$ ) in dry 2-propanol ( 4 mL ) was added TBD (1.12 $\mathrm{g}, 8.00 \mathrm{mmol}$ ), and the reaction was stirred at room temperature for 15 hours. Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ (aq.) was added and the mixture was extracted with EtOAc. The combined organic fractions were washed with pH 2 buffer and water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The residue was purified by column chromatography (95:5 to 8:2 petroleum ether/EtOAc) to yield product as a colourless oil $(0.147 \mathrm{~g}$, 50\%). $v\left(\mathrm{~cm}^{-1}\right) ; 2924$ (C-H stretch), 1734 ( $\mathrm{C}=\mathrm{O}$ stretch), 1505 (C=C stretch), 1214 (CO stretch), 841 (Ar-H bend); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 9.85(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 6.84-$ $6.76(4 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\mathrm{H}), 3.77\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{O}\right), 1.83-1.75(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHC}(\mathrm{CHO})), 1.73-1.65$ $(1 \mathrm{H}, \mathrm{m}, \mathrm{CH} H \mathrm{C}(\mathrm{CHO})), 1.48-1.34\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}(\mathrm{CHO})\right.$ ), 1.33-1.20(10H, m, $\left.\mathrm{CH}_{2}\right), 1.27\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{C}(\mathrm{CHO})\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{3} \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125\right.$
