^a Autumn and spring incidences of TuYV were compared by a two-sample binomial test.

^b Rook's case connection of Black-White join-count statistic was used to test for the spatial autocorrelation of the TuYV-infected plants in each of the 27 oilseed rape fields, where possible.

* Significant at $P < 0.05$,

*** Significant at $P < 0.001$

n.a. = not applicable because the virus incidence was zero.

n.d. = not determined because the virus incidence was 100%.
