#### Abstract

The synthesis of a series of pyridones, from their 2-hydroxypyridine or 2-methoxypyridine precursors, is described, along with studies into their reductions to saturated heterocycles. A number of 5 -acylpyridones were prepared and were evaluated as substrates for asymmetric transfer hydrogenation prior to conversion to saturated heterocycles. The enantioselective reduction of 5-acetyl-1-benzylpyrimidine-2,4(1H,3H)-dione is also described. © 2015 Elsevier Science. All rights reserved

## 1. Introduction

The full or partial reduction of heterocyclic substrates provides a route to numerous target molecules, several of which are represented in pharmaceuticals, fine chemicals and materials. In this paper we describe the development of routes to a series of substituted N -containing heterocycles, including alkoxypyridines, N-benzyl pyridines and acyl pyridines, together with a racemic and asymmetric reduction of the latter.

As part of an ongoing project, we were interested in developing routes to bis-piperidine (general structure 1) and close derivatives. ${ }^{1}$ We envisaged that these could be prepared from 2-methoxypyridines $\mathbf{2 a}-\mathbf{2 e}$, via $\mathbf{3 a - 3 e}$, to the saturated products $\mathbf{4 a}-\mathbf{4 e}$. In addition, the conversion of 5-acyl-2-methoxy pyridines $\mathbf{5 - 9}$ to alcohols $\mathbf{1 0 - 1 4}$ by asymmetric transfer hydrogenation (ATH) was investigated. The subsequent formation of $\mathbf{1 5}$ and $\mathbf{1 6 a} / \mathbf{b}$ serves to illustrate the synthetic value of the latter transformation.

## 2. Results and Discussion.

We initially studied the reductions of a number of 5substituted pyridones. Acid 3a was prepared by the reaction of 6-hydroxynicotinic acid with benzyl bromide in the presence of KOH in methanol. Esterification of 2a with $\mathrm{H}_{2} \mathrm{SO}_{4}$ and methanol ( $72 \%$ yield, Scheme 1) gave 2b which underwent reaction with benzyl bromide in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ to give methyl N -benzylpyridone-5carboxylate 3b in 29 \% yield. ${ }^{2}$

Scheme 1. Synthesis of pyridones 3b and 3c.

Pyridone 3c was prepared via reduction of ester $\mathbf{2 b}$ with $\mathrm{LiAlH}_{4}$ to give pyridine 2c followed by reaction with benzyl bromide (Scheme 1). ${ }^{2}$ The reduction reactions are summarised in Table 1. Pyridone 3a was reduced with Pd / C under forcing conditions ( 25 bar hydrogen) to give lactam $4 \mathbf{a}$ in near quantitative yield (entry 1 ). No reduction was observed with the catalysts $(R)-\left[\mathrm{Ru}(\mathrm{BINAP})(\mathrm{OAc})_{2}\right]^{3}$ $(R)-\mathbf{1 7}$ or $[\mathrm{Rh}(\mathrm{I})((R, R) \text {-EtDuPhos })]^{4} \quad(R, R)-\mathbf{1 8}$ under a variety of conditions. Transfer hydrogenation catalyst $(R, R)-19$ (a catalyst related to the Noyori catalyst 20) ${ }^{5}$ was tested but with no success (entry 4). Pyridone 3b was readily reduced with $\mathrm{Pd} / \mathrm{C}$ under a balloon of hydrogen to give lactam $\mathbf{4 b}$ (entry 5). The use of $(R, R)-18$ resulted in 75 $\%$ conversion to racemic $\mathbf{4 b}$ (entry 6). When $\mathrm{Pd} / \mathrm{BaSO}_{4}$ was used to reduce $3 \mathbf{c}$, the fully hydrogenated and $\mathrm{C}-\mathrm{O}$ cleaved product 21 was obtained in $71 \%$ yield (entry 7). The hydrogenation of the pyridone group was achieved with $\mathrm{PdO}_{2}$ however, resulting in formation of the desired lactam $\mathbf{4 c}$ in $65 \%$ yield (entry 8). An asymmetric synthesis of a compound related to $\mathbf{4 c}$ ( $95 \%$ ee) has been reported by Park et al., via the phase transfer organo-catalytic monoalkylation of a malonamide. ${ }^{6}$

( $R, R$ ) $\mathbf{- 1 9}$

$(R, R)-20$

An approach to the natural product cytisine ${ }^{7}$ was envisaged through the asymmetric hydrogenation of pyridone $\mathbf{3 d}$, since the product, lactam $\mathbf{4 d}$, may be converted to the cytisine precursor lactam $4 \mathrm{e}^{8}$ through the three step method detailed by Sivaguru et al. ${ }^{9}$ Imide 3d was prepared via the pyridine $2 \mathbf{d}$, formed by the coupling of pyridine $2 \mathbf{c}$ with
glutarimide under Mitsunobu conditions ${ }^{10}$ (Scheme 2). Pyridine 2d was then converted to $\mathbf{3 d}$ upon treatment with benzyl bromide in $59 \%$ yield as a colourless powder. An X-ray crystallographic analysis confirmed the structure (Figure 1), and that alkylation had occurred exclusively on $N(8) .{ }^{11}$

Scheme 2. Synthesis of 3d.

Figure 1: X-ray crystal structure of 3d.
The hydrogenation of pyridone $\mathbf{3 d}$ was carried out using a range of homogeneous and heterogeneous catalysts (Table 2). Using platinum oxide in ethanol for 6 h at room temperature, the desired lactam $4 \mathbf{d}$ was formed in $100 \%$ conversion (entry 1 ).

Conducting the reduction at an elevated pressure of 5 bar at room temperature for 18 h was reproducibly found to give the desired product $\mathbf{4 d}$ in high yield (entry 2). Asymmetric hydrogenation of pyridines is generally known to be challenging, ${ }^{12,13}$ however some attempts were made. Partial conversion to lactam 4 d was observed using $(R, R)$ - $\mathbf{1 8}$ following a prolonged reaction time of 72 h at $40^{\circ} \mathrm{C}$ under 30 bar of hydrogen (entry 3) however the product was racemic. $(R)$ - $\mathbf{1 7}$ was remarkably active, resulting in $100 \%$ conversion to 4 d after 6 h at $30^{\circ} \mathrm{C}$ ( 50 bar hydrogen) however again the sample was found to be racemic. The absence of any enantioselectivity may be due to the tautomeric forms of the structure. ${ }^{14}$ With lactam ( $\pm$ )-4d in
hand, a racemic formal synthesis of cytisine was completed (Scheme 3). ${ }^{9}$ Treatment of ( $\pm$ )-4d with sodium borohydride and cerium chloride gave $\alpha$-hydroxylactam 22 in $70 \%$ yield as an inseparable mixture of diastereomers which were not purified.

Scheme 3. Conversion of $\mathbf{3 d}$ to cytisine precursor $\mathbf{4 e}$.
Treatment of $\alpha$-hydroxylactam 22 with titanium chloride and DIPEA mediated the formation of the enamide $23 .{ }^{15}$ Oxidation was achieved by treatment of the lithium enolate of $\mathbf{2 3}$ (formed with LDA) with PhSeCl at $-78^{\circ} \mathrm{C}$ followed by oxidation with $\mathrm{NaIO}_{4}$ in a solution of THF : MeOH : $\mathrm{H}_{2} \mathrm{O}(18: 6: 2)$, resulting in formation of a sample containing a mixture of the desired pyridone $4 \mathbf{e}$ and an unidentified product.

Reaction of chloride 24 (formed from 2c using thionyl chloride) with 2-hydroxypyridine and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in toluene at $115{ }^{\circ} \mathrm{C}$ for 10 h , successfully gave methoxypyridine 2 e in $63 \%$ yield as the major isomer, alongside the $O$-substituted isomer, $\mathbf{2 5}$ which was isolated in $12 \%$ yield, (Scheme 4). Longer reaction times ( 18 h ) resulted in formation of only traces of 25.

Scheme 4. Synthesis of $\mathbf{3 e}$
Methoxypyridine 2e, readily underwent alkylation with benzyl bromide and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetonitrile at $80{ }^{\circ} \mathrm{C}$ for 8 h to give pyridone 3 e in $51 \%$ yield as a colourless powder, following recrystallisation from ethanol (Scheme 4). An Xray diffraction solution served to confirm the structure (Figure 2). ${ }^{11}$

Figure 2. X-ray crystallographic structure of 3e.
Pyridone 3e was reduced with $\mathrm{Pd} / \mathrm{C}$ under a balloon of hydrogen at $30{ }^{\circ} \mathrm{C}$ to give lactam 26 in $90 \%$ conversion after 17 h (Table 3, entry 1). Preferably (due to ease of subsequent purification) reduction was achieved with $\mathrm{PtO}_{2}$ under a balloon of hydrogen at $30^{\circ} \mathrm{C}$. At a larger scale of $644 \mathrm{mg}, 90 \%$ conversion of the starting material was achieved (as determined by ${ }^{1} \mathrm{H}$ NMR) after 20 h , providing pure lactam 26 in $75 \%$ yield following silica gel chromatography (entry 2). Treatment of 22 with $\mathrm{Et}_{3} \mathrm{SiH}$ also resulted in its conversion to lactam 26. Pyridone $\mathbf{3 e}$ underwent partial conversion to lactam 26 with $(R, R)-\mathbf{1 8}$ following a reaction time of 18 h at room temperature under 20 bar hydrogen (entry 3 ), however the product was racemic.

The racemic synthesis of bis-piperidine was completed by treatment of $\mathbf{2 6}$ with $\mathrm{LiAlH}_{4}$ in THF $\left(0^{\circ} \mathrm{C}\right.$ to rt) to give $\mathbf{1}$ $(\mathrm{R}=\mathrm{Bn})$ in 37 \% yield following careful purification. Alternatively, reduction with $\mathrm{Ru}_{3}(\mathrm{CO})_{12}(2 \mathrm{~mol} \%)$ and $\mathrm{Et}_{3} \mathrm{SiH}$ (7 eq.) in toluene at $100^{\circ} \mathrm{C}$ for 18 h resulted a clean crude reaction ( ${ }^{1} \mathrm{H}$ NMR), ${ }^{16}$ to give product $1(\mathrm{R}=\mathrm{Bn})$ in 57 \% yield. Debenzylation of bis-piperidine $1(\mathrm{R}=\mathrm{Bn})$ was achieved with $\mathrm{Pd}(\mathrm{OH})_{2}$ under an atmosphere of hydrogen. A sample containing the free amine was isolated through the use of an Isolute-XL SCX amine scavenger thiol resin. The crude reaction mixture was conveniently passed through the resin which was then washed with solvent to remove non basic impurities. A sample containing the amine $\mathbf{1}(\mathrm{R}=\mathrm{H})$ was obtained showing only a trace of the starting material by ${ }^{1} \mathrm{H}$ NMR.

The asymmetric transfer hydrogenation (ATH) of pyridyl methyl ketone $\mathbf{5}$, to $\mathbf{1 0}$, followed by conversion to the corresponding pyridone, $\mathbf{1 5}$ and then hydrogenation would be predicted to lead to the formation of two enantiomerically enriched diastereomers, 16a and 16b, ${ }^{17}$ (Scheme 5) An alternative approach to $\mathbf{1 5}$ would be through the formation of $\mathbf{2 7}$ followed by reduction.

Scheme 5. Synthesis of diastereomers 16a and 16b.
In principle, lactams $\mathbf{1 6 a} / \mathbf{b}$ may be subsequently converted to methylated derivatives of the cytisine precursor (lactam 4e) through substitution with 2-hydroxypyridine. ${ }^{7}$ However, optically pure 5 -substituted lactams are in themselves potentially useful in other applications. ${ }^{1,18}$ The synthesis of ketones 5 and 27 was achieved via the alkylation of Weinreb amide $\mathbf{2 8}{ }^{19}$ which was obtained in 68 \% yield from the ester 2b. Direct alkylation with methyl magnesium chloride gave the pyridyl methyl ketone 5 in 61 \% yield. The synthesis of pyridone methyl ketone 27 was achieved via treatment of 5 with benzyl bromide in acetonitrile at $80^{\circ} \mathrm{C}$ (Scheme 6).

Scheme 6. Synthesis of ketones 5 and 27.

The ATH of pyridyl ketones, similar in structure to 5, has been reported. ${ }^{20,21}$ Ikariya described the reduction of a range of pyridyl alkyl ketones in high enantioselectivity with ( $S, S$ )-Ru(TsDPEN), ( $S, S$ )-20. Pyridyl alcohols ( $(S)$-29, $(S)$ 30, and $(S)$ - $\mathbf{3 1}$ were obtained in $93 \%, 98 \%$ and $92 \%$ ee respectively (Figure 3). ${ }^{21}$ Enantioface selection during these reductions was comparable to the reduction of aromatic ketones.

Figure 3. Optically pure pyridyl alcohols obtained by ATH with $(S, S)-21 .^{21}$

The ATH of ketones 5 and 27 was carried out with the catalyst $(R, R) \mathbf{1 9}$. Neat formic acid/triethylamine (FA/TEA) was used as solvent at a substrate concentration of 1 M in all cases (Table 4).

Pyridyl methyl ketone 5 underwent complete conversion to alcohol, ( $S$ )-10 in $82 \%$ ee (entry 1). The ee was slightly lower ( $75 \%$ ee) when run in methanol at room temperature (entry 2). Pyridone methyl ketone 27 underwent complete conversion to ( $R$ )- $\mathbf{1 5}$ in only $42 \%$ ee (entry 3 ). The absolute configuration of the alcohol product obtained from reduction of ketone $\mathbf{5}$ with $(S, S)$-19 is in accordance with what would be expected through the standard reduction mechanism of aryl methyl ketones such as acetophenone. ${ }^{5}$ Pyridone ketone 27 appeared to also follow this trend; the use of the $(R, R)$ catalyst resulted in formation of the $(R)$ alcohol.

A further series of alkyl derivatives $\mathbf{6 - 9}$ was studied; each was directly obtained via alkylation of Weinreb amide 28. ${ }^{19}$ Neat FA/TEA was used as solvent at a concentration of 2 M for these ATH studies, together with 5 (Table 5).

The $n$-alkyl derivatives, methyl ketone 5 and n-butyl ketone 6 were reduced in highest enantioselectivity; $83 \%$ and 76 \% ee respectively (entries 1 and 2 ). The secondary alkyl ketones, isopropyl ketone 7 and cyclohexyl ketone $\mathbf{8}$ were reduced in $53 \%$ and $35 \%$ ee respectively (entries 3 and 4). In each case the products were assigned the $R$ configuration, in analogy with related compounds. The reduction of pyridyl phenyl ketone $\mathbf{9}$ resulted in formation of $\mathbf{1 4}^{22}$ in $48 \%$ ee.

Following the ketone ATH results, pyridyl methyl ketone 5 was chosen for the large scale synthesis of diastereomers 16a and 16b, due to its relatively higher enantioselectivity during ATH. A racemic reduction of 5 was achieved with $\mathrm{NaBH}_{4}$, resulting in formation of alcohol $\mathbf{1 0}$ in quantitative yield (Scheme 7). Alcohol 10 readily underwent alkylation with benzyl bromide and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetonitrile at $80^{\circ} \mathrm{C}$ for 24 h to give the racemic pyridone 15 in $63 \%$ yield. The hydrogenation of pyridone 15 was carried out with $\mathrm{PtO}_{2}$ in methanol under 5 bar of hydrogen (Scheme 7) and diastereomers (in order of elution) ( $\pm$ )-16a and $( \pm)-\mathbf{1 6 b}$ were obtained.

Scheme 7. Synthesis of diastereomers 16a and 16b.
Conveniently, ( $\pm$ )-16a provided crystals which were analysed by X-ray diffraction to confirm its structure (Figure 4) ${ }^{11}$ which may be described as syn with respect to the relative positions of the two adjacent hydrogen atoms. Hence, ( $\pm$ )-16b may be assigned as the anti isomer.

Figure 4. a. X-ray structure of $\mathbf{1 6 a}$; b. corresponding schematic structure of $( \pm) \mathbf{- 1 6 a}$.

The ATH of ketone 5 on a larger scale ( 1.0 g ) gave pyridine $(R)-\mathbf{1 0}$ in $95 \%$ yield and $78 \%$ ee. Pyridine $(R)-\mathbf{1 0}$ readily underwent alkylation with benzyl bromide and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetonitrile at $80^{\circ} \mathrm{C}$ for 24 h to give the pyridone $(R)-\mathbf{1 5}$ in $71 \%$ yield (Scheme 8) however the sample suffered from loss of enantiopurity, and the ee was determined to be $45 \%$. Repeating the experiment in the absence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ resulted in formation of $(R)-15$ in $63 \%$ yield. The ee of this sample was not directly determined, but following reduction in the next step it was found to be unchanged at $78 \%$ ee.

Scheme 8. Asymmetric synthesis of $\mathbf{1 6 a}$ and $\mathbf{1 6 b}$.
Hydrogenation of pyridine $\mathbf{1 5}$ with $\mathrm{PtO}_{2}$ resulted in formation of alcohols $\mathbf{1 6 a}$ and $\mathbf{1 6 b}$, however a relatively higher level of hydrogenolysis occurred (Scheme 8). Following purification, 16a and 16b were isolated in $20 \%$ and $32 \%$ yield respectfully, alongside lactam 32. The diastereopurities were $100 \%$ for 16a; and $72 \%$ for 16b respectively and the ee of both products was $78 \%$.

In a related investigation, the ATH of 5-acetyluracil $\mathbf{3 3}$ and $N$-benzyl 5-acetyluracil 34 was investigated to enable comparison with the heterocyclic methyl ketones described above. 5-Acetyluracil was benzylated by treatment with NaH in DMF.

Following recrystallisation from methanol, $N$-benzyl-5acetyluracil, $\mathbf{3 4}$ was obtained in $39 \%$ yield as crystalline white needles; an X-ray diffraction study confirmed that alkylation had occurred exclusively on $N(7 \mathrm{~A})$ (Figure 5). ${ }^{11}$

Figure 5. X-ray crystal structure of $\mathbf{3 4}$.
The ATH of $\mathbf{3 3}$ was carried out with the catalyst $(R, R)-19$ (Table 6). Following a reaction time of 17 h at room temperature, 34 underwent $100 \%$ conversion to inseparable diastereomers 35 in a ratio of $3.1: 1$ (entry 1 ; relative/absolute configurations and ees were not determined).

The ATH of the benzylated derivative $\mathbf{3 4}$ was carried out with $(R, R)$ - and $(S, S)-\mathbf{1 9},(R, R)-\mathbf{2 0}$ and racemic TH catalyst, [(p-cymene) $\left.\mathrm{Ru}\left(\mathrm{TsCH}_{2} \mathrm{CH}_{2} \mathrm{NH}\right) \mathrm{Cl}\right] 3$ 36, the latter being used at a higher loading ( $6 \mathrm{~mol} \%$ ) to achieve full conversion within 20 h . As the diastereoisomeric ratio was determined in each case by ${ }^{1} \mathrm{H}$ NMR, it was possible to assign the chiral HPLC peaks to the correct pairs of enantiomers. This enabled the ee of each diastereosiomer of 37 to be determined. The use of catalyst $(R, R)-\mathbf{1 9}$ resulted in the formation of 37 in a 4:1 diastereoisomeric ratio in $92 \%$ and $33 \%$ ee respectively (entry 4 ) whilst the use of catalyst $(S, S)-19$ gave similar results (entry 5). The relative configuration of the diastereoisomers of $\mathbf{3 7}$ was not determined. The catalyst-dependent ee in each reduction
suggests that conjugate reduction occurs first, resulting in formation of enol intermediate $\mathbf{3 8}$ which would tautomerise to give racemic ketone 39. The subsequent ketone reduction of ketone $\mathbf{3 9}$ may then proceed via a (dynamic)kinetic resolution. ${ }^{23}$

In conclusion, in this paper a series of pyridine-based heterocycles have been prepared and their selective reductions examined with a range of catalysts. The new methodology provides access to potentially valuable building blocks for the synthesis of saturated heterocyclic targets.

## Experimental Section

General information. All reactions unless otherwise stated were run under an atmosphere of nitrogen in glassware (round bottomed flasks or Schlenk tubes). Room temperature refers to ambient room temperature $\left(20-22^{\circ} \mathrm{C}\right)$, and $0{ }^{\circ} \mathrm{C}$ refers to an ice slush bath. Heated experiments were conducted using thermostatically controlled oil baths. Reactions were monitored by thin layer chromatography (TLC) using aluminium backed silica gel 60 (F254) plates, visualised using UV254 nm and PMA, potassium permanganate and ninhydrin dips as appropriate. Flash column chromatography was carried out routinely using 60 A silica gel (Fluorochem). NMR spectra were recorded on Bruker DPX-300 ( 300 MHz ), DPX-400 ( 400 MHz ), DRX$500(500 \mathrm{MHz})$, AV III -600 ( 600 MHz ) and AV II-700 $(700 \mathrm{MHz})$ instruments. Chemical shifts are reported in $\delta$ units, parts per million. ${ }^{1} \mathrm{H}$ NMR spectra run in $\mathrm{CDCl}_{3}$ are downfield from TMS; ${ }^{1} \mathrm{H}$ NMR spectra run in solvents other than $\mathrm{CDCl}_{3}$, and all ${ }^{13} \mathrm{C}$ NMR spectra are referenced to the solvent signal. Coupling constants $(J)$ are measured in Hertz. IR spectra were recorded on a Nicolet Model Avatar 320 FTIR fitted with a Specac golden gate single reflection diamond attenuated total reflection top plate. Mass spectra were recorded on a Bruker Esquire2000 (ESI) mass spectrometer. Determinations of ee were measured by HPLC or GC using Chiralcel columns supplied by Daicel. Optical rotations were measured on an AA-1000 polarimeter. Hydrogen gas (99.995 \% minimum) was supplied by BOC. Hydrogenations were carried out in a Parr bench-top hydrogenator ( 0.3 L ).

1-Benzyl-6-oxo-1,6-dihydropyridine-3-carboxylic acid, $3 \boldsymbol{a} .{ }^{24}$ Under nitrogen, a solution of 6-hydroxynicotinic acid $(2.10 \mathrm{~g}, 15.07 \mathrm{mmol})$ and potassium hydroxide ( 2.96 g , 52.74 mmol ) in water ( 3.59 mL ) and methanol ( 17.94 mL ) was stirred at $70^{\circ} \mathrm{C}$ for 5 min before benzyl bromide ( 3.58 $\mathrm{mL}, 5.15 \mathrm{~g}, 30.13 \mathrm{mmol}$ ) was added. The mixture was stirred at $70{ }^{\circ} \mathrm{C}$ for 90 min before the reaction was cooled to room temperature concentrated under reduced pressure. The resulting residue was diluted with water ( 10 mL ) and washed diethyl ether ( $2 \times 10 \mathrm{~mL}$ ). The aqueous phase was
acidified to pH 1 with $\mathrm{HCl}(2 \mathrm{M})$ and the resulting white precipitate was washed with water and dried under reduced pressure to give the crude product $(2.68 \mathrm{~g})$ as a white solid. A portion of the crude product ( 0.290 g ) was purified by preparative reverse phase HPLC (Phenomenex Gemini-NX axia Prep $\mathrm{C}_{18}$ OBD column, $5 \mu$ silica, 50 mm diameter, 150 mm length), using decreasingly polar mixtures of water (containing $0.1 \%$ formic acid) and MeCN as eluents. Following concentration under reduced pressure, product, 3a ( $0.210 \mathrm{~g}, 0.916 \mathrm{mmol}$ ) was obtained as a white powder; Mp 210-214 ${ }^{\circ} \mathrm{C}$; (found (ESI): $\mathrm{M}^{+}+\mathrm{H}, 230.0807$. $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{NO}_{3}$ requires $\mathrm{M}, 230.0812$ ); $v_{\text {max }} 3325,1708,1638$, 1568, 1539, 1497, 727, $692 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}\right.$, DMSO- $d_{6}$ ) $12.86(1 \mathrm{H}, \mathrm{bs}, \mathrm{OH}), 8.56\left(1 \mathrm{H}, \mathrm{d}, J 2.5, \mathrm{H}_{3}\right), 7.80(1 \mathrm{H}, \mathrm{dd}$, $\left.J 9.5,2.5, \mathrm{H}_{2}\right), 7.39-7.24(5 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 6.46(1 \mathrm{H}, \mathrm{d}, J$ 9.5, $\mathrm{H}_{1}$ ), $5.20\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right)$; $\delta_{\mathrm{C}}(101 \mathrm{MHz}, \mathrm{DMSO}) 165.2$, 161.5, 149.3, 138.9, 136.8, 128.6, 127.7, 127.7, 118.9, 109.6, 51.5; $m / z$ (ESI) $229.9\left(\mathrm{M}^{+}-1\right)$.

Methyl 6-methoxynicotinate, 2b. ${ }^{25}$ A suspension of 6methoxynicotinic acid $\mathbf{2 a}(2.90 \mathrm{~g}, 18.94 \mathrm{mmol})$ in methanol ( 28.0 mL ) and sulfuric acid ( $16 \mathrm{M}, 1.1 \mathrm{~mL}, 20.64 \mathrm{mmol}$ ) was stirred at $80{ }^{\circ} \mathrm{C}$ for 16 h before the mixture was allowed to cool. The mixture was neutralised by careful addition of sodium bicarbonate. Following concentration under reduced pressure, water ( 20 mL ) and aqueous sodium bicarbonate $(10 \mathrm{~mL})$ were added. Following extraction with DCM ( 3 x 50 mL ), the organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give the product $\mathbf{2 b}(2.480 \mathrm{~g}, 14.84 \mathrm{mmol}, 72 \%)$ as a white powder; (Found: C, 57.11; H, 5.36; N, 8.30. $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{3}$ requires C, $57.48 ; \mathrm{H}, 5.43 ; \mathrm{N}, 8.38 \%$ ); $v_{\max } 2954,1720$, $1603,1568,1604,1496,783,730 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.83\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}\right), 8.14\left(1 \mathrm{H}, \mathrm{d}, J 8.7, \mathrm{H}_{2}\right), 6.76(1 \mathrm{H}$, $\left.\mathrm{d}, J 8.7, \mathrm{H}_{1}\right), 4.00\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(101$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 167.0, 150.2, 143.4, 139.9, 119.8, 110.8, 54.1, 52.2; $\delta_{\mathrm{C}}(101 \mathrm{MHz}, \mathrm{DMSO}) 162.1,141.3,132.5$, 119.7, 118.9, 59.7 (two peaks); $m / z$ (ESI) $168.1\left(\mathrm{M}^{+}+1\right)$.

Methyl 1-benzyl-6-oxo-1,6-dihydropyridine-3-carboxylate, 3b. ${ }^{26}$ A mixture of benzyl bromide ( $4.40 \mathrm{~mL}, 6.34 \mathrm{~g}, 37.05$ $\mathrm{mmol})$, methyl 6-methoxynicotinate $2 \mathrm{~b}(3.00 \mathrm{~g}, 17.96$ $\mathrm{mmol})$ and potassium carbonate ( $4.96 \mathrm{~g}, 35.89 \mathrm{mmol}$ ) in dry acetonitrile ( 72 mL ) was stirred at $80{ }^{\circ} \mathrm{C}$ for 48 h . The mixture was filtered and concentrated under reduced pressure and purified by column chromatography (ethyl acetate - hexane 1:1) to give product 3b ( $1.25 \mathrm{~g}, 5.14$ $\mathrm{mmol}, 29 \%$ yield) as a yellow oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $8.18\left(1 \mathrm{H}, \mathrm{d}, J 2.4, \mathrm{H}_{3}\right), 7.83\left(1 \mathrm{H}, \mathrm{dd}, J 9.6,2.4, \mathrm{H}_{2}\right), 7.40-$ $7.29(5 \mathrm{H}, \mathrm{m}, \mathrm{Ar} H), 6.58\left(1 \mathrm{H}, \mathrm{d}, J 9.6, \mathrm{H}_{1}\right), 5.17(2 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}_{2}$ ), $3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 164.6, 162.3, 142.6, 138.4, 135.5, 129.0, 128.3, 128.1, 119.9, 109.9, 52.7, 52.0.
(6-Methoxypyridin-3-yl)methanol, 2c. ${ }^{27}$ Under nitrogen, a suspension of lithium aluminum hydride solution in THF ( $1 \mathrm{M}, 6.58 \mathrm{~mL}, 6.58 \mathrm{mmol}$ ) in THF ( 3.39 mL ) was stirred at $0^{\circ} \mathrm{C}$ for 5 min . Methyl 6-methoxynicotinate $\mathbf{2 b}(1.0 \mathrm{~g}, 5.98$ mmol ) was added portionwise and the mixture was stirred for 10 m . The suspension was allowed to warm to room temperature and stirred for 2 h before the solution was
cooled to $0{ }^{\circ} \mathrm{C}$. The suspension was carefully quenched with water $(0.04 \mathrm{~mL}), 15 \% \mathrm{NaOH}(0.04 \mathrm{~mL})$ followed by water $(0.12 \mathrm{~mL})$. The resulting precipitate was filtered with celite and washed with ethyl acetate. 1-Benzyl-5-(hydroxymethyl)pyridin-2(1H)-one, 3c. ${ }^{28}$ A mixture of benzyl bromide ( $0.56 \mathrm{~mL}, 0.81 \mathrm{~g}, 4.71 \mathrm{mmol}$ ), 6-methoxypyridin-3-yl)methanol 2c ( $1.00 \mathrm{~g}, 7.19 \mathrm{mmol}$ ) and potassium carbonate $(1.30 \mathrm{~g}, 9.40 \mathrm{mmol})$ in dry acetonitrile ( 17 mL ) was stirred at $60^{\circ} \mathrm{C}$ for 18 h . The mixture was filtered, concentrated under reduced pressure and purified by column chromatography (methanol - ethyl acetate 5 : 95), to give product $\mathbf{3 c}(0.500 \mathrm{~g}, 2.32 \mathrm{mmol}, 32$ $\%$ yield) as a yellow oil; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.38-7.18$ $\left(7 \mathrm{H}, \mathrm{m}, \mathrm{Ar} H, \mathrm{H}_{3}, \mathrm{H}_{1}\right), 6.50\left(1 \mathrm{H}, \mathrm{d}, J 9.2, \mathrm{H}_{2}\right), 5.03(2 \mathrm{H}, \mathrm{s}$, $\mathrm{PhCH}_{2}$ ), 4.33 ( $2 \mathrm{H}, \mathrm{d}, J 5.5, \mathrm{H}_{4}$ ), $4.00-3.94$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{OH}$ ); $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 162.3,140.1,136.1,135.1,128.8$, 128.0, 127.9, 120.6, 120.1, 61.3, 52.0. The $O$-benzylation product was not isolated from the reaction mixture. An nOe ${ }^{1} \mathrm{H}$ NMR experiment supported the structural assignment: irradiation of the $\mathrm{CH}_{2} \mathrm{Ph}$ protons ( 5.03 ppm ) resulted in the excitation of proton $\mathrm{H}_{3}$ only.

General procedure A - alkene hydrogenation with hydrogen balloons. Under nitrogen, the alkene ( 1.00 mmol ) was loaded into a round bottomed flask containing a magnetic stirrer and the specified solvent was added. The heterogeneous catalyst (at the specified catalytic loading) was carefully added before the flask was evacuated with hydrogen and a balloon of hydrogen was attached. The solution was stirred vigorously for the specified time and temperature before the catalyst was removed by filtration with celite. Following solvent removal under reduced pressure the product was obtained, following purified by column chromatography (where applicable).

General procedure $B$ - alkene hydrogenation in $a$ hydrogenator. The alkene ( 1 mmol ) and catalyst (at the specified catalytic loading) were added to a small glass hydrogenation vial. A suba seal was attached and the contents were flushed with nitrogen for 10 min before the dry solvent (as specified) was added. The suba seal was removed and the vial was quickly placed into the hydrogenation apparatus. The hydrogenator was filled with hydrogen to the appropriate pressure before the pressure was nearly completely released. The hydrogenator was then filled again with hydrogen and the pressure was released. This fill release cycle carried out for a total of 3 times to ensure the vessel was sufficiently charged with hydrogen at the stated pressure. A magnetic stirrer box was placed under the hydrogenator to enable stirring for the specified time before the hydrogen was carefully released and the
apparatus was disassembled. Following concentration under reduced pressure, the product was obtained, following purified by column chromatography (where applicable).

General procedure for the ATH of ketones. Under nitrogen, FA/TEA (5:2, concentration w/r to ketone as specified) was added to a mixture of the ketone ( 1 mmol ) and $[\mathrm{Ru}($ tethTsDPEN)Cl] 19 ( $1 \mathrm{~mol} \%$ ). The solution was left stirring at $45{ }^{\circ} \mathrm{C}$ for the specified time before the product was obtained, following removal of the catalyst (the reaction mixture directly through a plug of silica gel using ethyl acetate - petroleum ether (1:1) as eluent). Conversion was primarily determined by ${ }^{1} \mathrm{H}$ NMR. Ee was determined by chiral GC or HPLC via direct analysis, or alternatively indirectly via acetate derivatisation of the product.

General procedure for the preparation of acetate derivatives. Where required, acetate derivatives of alcohols were prepared using the following general procedure; a solution of acetic anhydride ( 1 drop), alcohol ( 10 mg ) and DMAP ( 1 mg ) in DCM ( 1 mL ) was stirred at room temperature for 18 h . Following concentration under reduced pressure, the product was obtained following purification by column chromatography and used directly in GC or HPLC analysis.

General procedure for the formation of racemic standards: reduction of ketones with $\mathrm{NaBH}_{4}$. Racemic standards were prepared (unless otherwise specified) via reduction with $\mathrm{NaBH}_{4}$, using the following procedure: Under nitrogen, $\mathrm{NaBH}_{4}$ ( 1.1 mmol ) was added to a solution of the ketone (1 mmol ) in methanol and the solution was stirred at room temperature until the reaction reached completion. Saturated aqueous hydrogen carbonate was then added. Following extraction with DCM (3 x 5 mL ) the organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated under reduced pressure and purified by column chromatography (ethyl acetate - petroleum ether $1: 1$ ), to give the product. The sample was directly used as a racemic standard for chiral GC or HPLC analysis. In some cases this was not appropriate. Instead, two samples of the alcohol formed from opposite isomers of the catalyst were combined.

1-Benzyl-6-oxopiperidine-3-carboxylic acid, ( $\pm$ )-4a. ${ }^{29}$ This compound was prepared following the general procedure for alkene hydrogenation, using 1-benzyl-6-oxo-1,6-dihydropyridine-3-carboxylic acid, 3a $(30 \mathrm{mg}, 0.131$ mmol ) and palladium on carbon ( $10 \% \mathrm{w} / \mathrm{w}, 13 \mathrm{mg}, 1.22 \mathrm{x}$ $10^{-2} \mathrm{mmol}$ ) in methanol ( 1 mL ), following a reaction time of 20 h , at room temperature and 25 bar. Following concentration under reduced pressure, ( $\pm$ )-4a( $30 \mathrm{mg}, 0.129$ $\mathrm{mmol}, 99 \%$ yield) was obtained as a colourless oil. $\delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 10.40(1 \mathrm{H}, \mathrm{bs}, \mathrm{OH}), 7.28-7.10(5 \mathrm{H}, \mathrm{m}$, $\mathrm{Ar} H), 4.68\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{C} H_{2}\right), 4.36\left(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 14.7, \mathrm{CH}_{2}\right)$, $3.47-3.25\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{4}\right), 2.75-2.62\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{3}\right), 2.56$ ( 1 $\left.\mathrm{H}, \mathrm{dt}, J 17.9,4.5, \mathrm{H}_{1 \mathrm{~A}}\right), 2.42\left(1 \mathrm{H}, \mathrm{dt}, J 17.9,6.5, \mathrm{H}_{1 \mathrm{~B}}\right), 2.11$ - $1.99\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2 \mathrm{~A}}\right), 1.98-1.82\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2 \mathrm{~B}}\right) ; \delta_{\mathrm{C}}(101$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 176.9, 170.4, 136.1, 128.6, 128.1, 127.6, 50.6, 48.0, 38.8, 31.5, 25.5.

Methyl 1-benzyl-6-oxopiperidine-3-carboxylate, ( $\pm$ )-4b. ${ }^{29}$ This compound was prepared following the general procedure for alkene hydrogenation, using methyl 1-benzyl-6-oxo-1,6-dihydropyridine-3-carboxylate, 3b (100 $\mathrm{mg}, 0.411 \mathrm{mmol}$ ) and palladium on carbon ( $5 \% \mathrm{w} / \mathrm{w}, 88$ $\left.\mathrm{mg}, 4.13 \times 10^{-2} \mathrm{mmol}\right)$ in methanol ( 1 mL ) following a reaction time of 1 d , at $40^{\circ} \mathrm{C}$ under a balloon of hydrogen. Following solvent removal and purification by column chromatography (ethyl acetate - hexane $9: 1$ ), the product $( \pm)-\mathbf{4 b}(30 \mathrm{mg}, 0.121 \mathrm{mmol}, 29 \%$ yield) was obtained as colourless oil; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.30-7.14(5 \mathrm{H}, \mathrm{m}$, $\mathrm{Ar} H), 4.62\left(1 \mathrm{H}, \mathrm{d}, J 14.6, \mathrm{CH}_{2}\right), 4.46\left(1 \mathrm{H}, \mathrm{d}, J 14.6, \mathrm{CH}_{2}\right)$, $3.59\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.42-3.28\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}_{4}\right)$, 2.78-2.65 (1 $\left.\mathrm{H}, \mathrm{m}, \mathrm{H}_{3}\right), 2.54\left(1 \mathrm{H}, \mathrm{dt}, J 17.8,5.3, \mathrm{H}_{1 \mathrm{~A}}\right), 2.47-2.35(1 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{H}_{1 \mathrm{~B}}\right), 2.13-2.02\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2 \mathrm{~A}}\right), 2.00-1.89(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{H}_{2 \mathrm{~B}}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.5,168.8,136.7,128.5$, 128.0, 127.4, 52.1, 50.1, 47.9, 39.0, 30.7, 23.9; Enantiomeric separation was achieved by HPLC analysis (Chiralpak IA, $4.6 \mathrm{~mm} \times 250 \mathrm{~mm}$, hexane : IPA $85: 15$, 1 $\mathrm{mL} / \mathrm{min}, \mathrm{T}=30^{\circ} \mathrm{C}$, $13.3 \mathrm{~min}, 14.9 \mathrm{~min}$.).

1-Benzyl-3-hydroxymethyl 6-oxopiperidine, ( $\pm$ )-4c. ${ }^{30}$ This compound was prepared following the general procedure for alkene hydrogenation, using 1-benzyl-5-(hydroxymethyl)pyridin-2(1H)-one 3c (30 mg, 0.139 mmol ) and platinum oxide ( $3 \mathrm{mg}, 1.32 \times 10^{-2} \mathrm{mmol}$ ) in methanol ( 1 mL ), following a reaction time of 18 h at room temperature under 5 bar of hydrogen. Following concentration under reduced pressure, $( \pm)-4 \mathbf{c}(20 \mathrm{mg}, 0.091$ mmol, $66 \%$ yield) was obtained as an oil; $\delta_{\mathrm{H}}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.37-7.19(5 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.60\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, $3.64-3.54\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{4 \mathrm{~A}}\right), 3.53-3.45\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{4 \mathrm{~B}}\right)$, $3.32(1$ H, ddd, $J$ 12.1, 5.1, 1.8, H ${ }_{5 \mathrm{~A}}$ ), 3.02 ( 1 H , dd, $J 12.1,10.0$, $\left.\mathrm{H}_{5 \mathrm{~B}}\right), 2.57\left(1 \mathrm{H}, \mathrm{ddd}, J 17.8,6.3,3.5, \mathrm{H}_{1 \mathrm{~A}}\right), 2.44(1 \mathrm{H}$, ddd, $J$ 17.8, 11.1, 6.5, H1B ), 2.11-1.97 (1 H, m, H3), $1.94-1.85$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}_{2 \mathrm{~A}}\right), 1.53\left(1 \mathrm{H}\right.$, dtd, $\left.J 13.1,11.1,6.3, \mathrm{H}_{2 \mathrm{~B}}\right)$. ## Acknowledgements

We thank the EPSRC and AstraZeneca for funding (to AAB) and the National Crystallographic Service (Southampton University) for collecting the diffraction data for compound $\mathbf{3 4} .{ }^{37}$ The data for the other structures ( $\mathbf{3 d}, \mathbf{3 e}$ and 16a) was collected on an Oxford Diffraction Gemini instrument obtained through the Science City Project with support from Advantage West Midlands and part funded by the European Regional Development Fund. Johnson Matthey are thanked for supplying samples of commercially-available catalyst $\mathbf{1 9}$ used in this project. We thank Dr Reddys for the donation of a sample of the $\mathrm{Ru}(\mathrm{EtDuPHOS})$ complex 18. Dr Peter Quayle (University of Manchester) is thanked for useful discussions.
