S Supporting Information
Catalysed used in $\mathrm{C}-\mathrm{N}$ bond formation.

ABSTRACT: The application of a series of (cyclopentadienone)iron tricarbonyl complexes to "borrowing hydrogen" reactions between amines and alcohols was completed in order to assess their catalytic activity. The electronic variation of the aromatic groups flanking the $\mathrm{C}=\mathrm{O}$ of the cyclopentadienone influenced the efficiency of the reactions; however, in other cases, the Knölker catalyst $\mathbf{1}$, containing trimethylsilyl groups flanking the cyclopentadienone ketone, gave the best results. In some cases, the change of the ratio of amine to alcohol improves the conversion significantly. The application of iron catalysts to the synthesis of a range of amines, including unsaturated amines, was investigated.

## INTRODUCTION

"Hydrogen borrowing" is a term commonly used to describe the use of an organometallic catalyst to form a new $\mathrm{C}-\mathrm{N}$ or $\mathrm{C}-\mathrm{C}$ bond with the generation of water as the only side product. ${ }^{1}$ In the case of the $\mathrm{C}-\mathrm{N}$ bond formation, the key steps are (i) the sequential removal of hydrogen from an alcohol to form an aldehyde or ketone through oxidation, (ii) the formation of an imine via reaction with an amine, and (iii) the reduction of the imine to the corresponding amine by the hydride of the catalyst used in step 1 (Scheme 1).

There are many reports of the use of metal-based organometallic catalysts for this application; however, the majority of examples are based on precious metals such as ruthenium, iridium, etc. ${ }^{2 a-f}$ although with some recent work reported on the use of lower cost metals such as manganese. ${ }^{2 g}$ Iron-based catalysts for organic transformations represent a desirable alternative due to the low cost and ready availability of this element. ${ }^{3-11}$ In recent research, (cyclopentadienone)iron tricarbonyl complexes have been extensively applied to the oxidation of alcohols, ${ }^{4}$ the reduction of imines, ${ }^{5}$ and the reduction of ketones (including asymmetric examples). ${ }^{6}$ The

## Scheme 1. Steps of a "Hydrogen Borrowing" Reaction

use of these complexes in hydrogen borrowing reactions has only been reported recently however. ${ }^{5-9}$ The first example was in 2014 by Feringa et al., ${ }^{7}$ using complex 1 as the precatalyst. ${ }^{12}$ Scheme 2 illustrates the reaction cycle; the active species 2 is generated in situ through loss of a CO from the precatalyst 1 using one of a number of activation methods. A hydride

Scheme 5. Synthesis of Aryl-Substituted Iron(cyclopentadienone) Catalysts

intermediate, the Knölker complex 3, ${ }^{13}$ is generated through the oxidation step, and this provides the hydride for the reduction step.

In our own studies, we previously reported the use of iron catalyst 4 in the synthesis of a range of secondary amines via borrowing hydrogen methodology from aryl amines and primary alcohols, although our best results were obtained from the reactions of benzyl alcohols with aromatic amines (Scheme 3). ${ }^{8}$

Zhao et al. published a modification to the methodology whereby the addition of a Lewis acid to increase the reactivity of the imine assisted the imine reduction step to form the desired final amine product in reactions with secondary alcohols (Scheme 4). ${ }^{9}$

We have continued to work on an extended range of iron complexes for hydrogen borrowing applications, and on extending the scope of the catalysts, and our recent detailed results from this study are described below.

## RESULTS AND DISCUSSION

To date, the iron cyclopentadienone complexes used in $\mathrm{C}-\mathrm{N}$ bond formation include the tetraphenyl-substituted 4 and the complex 1, and close derivatives of these. ${ }^{5-10}$ Complexes analogous to $\mathbf{1}$, but containing aromatic rings flanking the central $\mathrm{C}=\mathrm{O}$, benefit from the ease of preparation ${ }^{14}$ and offer an opportunity to investigate the effect of changes to the electron-rich or electron-poor nature of the substituent groups on their reactivity. Hence, iron complexes 5-9 and 16, each based on the cyclohexyl backbone, were targeted for preparation via an intramolecular $\mathrm{Fe}(\mathrm{CO})_{5}$-catalyzed cyclization of dialkyne precursors $\mathbf{1 0 - 1 5}{ }^{14}$

The synthesis of iron complexes $5-8$ was achieved starting from the respective diaryl dialkyne precursors 10-13, themselves synthesized via a Sonogashira reaction ${ }^{15}$ (Scheme 5), except for $\mathbf{1 2}$, which was more challenging and required an alternative set of conditions to yield intermediate 12, but with a yield of only $12 \%$. The synthesis of iron complexes using the intramolecular cyclization approach was successful for compounds 5-8, giving products in yields of 91-98\% (Scheme 5). ${ }^{14}$ The synthesis of iron complex 9 was unsuccessful, and the
reaction resulted in the complete decomposition of the starting material. However, the electron-deficient iron bis-trifluoromethylphenyl complex 16 was prepared in a yield of $97 \%$ from the dialkyne precursor 15. Crystals of complex 6 suitable for analysis by X-ray diffraction were grown by slow evaporation from EtOAc (Figure 1, full details in the Supporting

Figure 1. Single-crystal X-ray structure of 6. Hydrogens were omitted for clarity, and ellipsoids were drawn at $50 \%$ probability.

Information, Table S1). An interesting aspect of the structure is the twisted nature of the aromatic rings flanking the $\mathrm{C}=\mathrm{O}$ bond of the cyclopentadienyl group, creating a "propeller-type" arrangement. ${ }^{{ }^{6}}$

Before testing all of the catalysts, we screened a number of solvents in the reaction between aniline 17 and benzyl alcohol 18 to give amine 19 (Scheme 6) using catalyst 5 for the initial tests. Activation of the catalyst was achieved using trimethylamine oxide. ${ }^{14 b, 16}$ Of the solvents tested, good results were obtained using xylene, toluene, tetrahydrofuran, and ethyl acetate, which all gave conversions of $>85 \%$ with the best conversion of $90 \%$ being observed with xylene. The use of cyclopentylmethyl ether was also examined as this solvent had been previously used with success by Feringa, ${ }^{7}$ but only a $70 \%$ conversion was observed in our study. A poorer result was obtained with the use of diethyl ether with a conversion of $60 \%$, and the use of dichloromethane resulted in the formation of an insoluble solid with no conversion to the desired product. However, this solid was not characterized.

With a screening of possible solvents complete, xylene was selected for use in further "hydrogen borrowing" reactions with iron complexes 6-8 and $\mathbf{1 0}$ to compare their potential for the catalysis of the reaction of amine 17 with a range of primary alcohols to give products 19-24 (Table 1). Conversions were recorded in all cases, and isolated yields were obtained where stated. For the reaction with benzaldehyde, the highest conversions were achieved using the more electron-rich and electron-poor iron complexes analogues, 7 and 10, which gave conversions of $91 \%$ and $87 \%$, respectively. Iron complexes 6 and 8 gave lower conversions of $60 \%$ and $66 \%$, respectively. This pattern was not consistent throughout the substrates

Table 1. Results of $\mathrm{C}-\mathrm{N}$ Bond Formation via "Hydrogen Borrowing" Reactions ${ }^{a}$

${ }^{a} \mathrm{Nd}=$ not determined.
however. Catalyst 7 generally gave lower conversions, while the phenyl catalyst 5 and the bis $p$-methyoxyphenyl catalyst 6 performed well for most substrates. Some combinations were quite specific; for example, catalyst 10 was the best for the reaction with 4 -phenylbutanol, while 5 and $\mathbf{6}$ were significantly better than the other catalysts for the conversion of 2-(4methoxyphenyl)ethanol.

3-(4-Methoxyphenyl)-1-propanol also reacted in high yield with substituted anilines using the bis(methoxyphenyl)substituted complex 6 to give products 25 and 26 (Scheme 7). $N$-Methylaniline gave a tertiary amine product 27 in $50 \%$ yield using the same catalyst. Under the conditions used, which required an excess of amine in line with our earlier communication, ${ }^{8}$ more basic nonaromatic amines such as benzylamine, pyrrolidine, and 4-phenylbutylamine failed to give products, possibly due to catalyst inhibition. ${ }^{17}$ Diphenylamine also failed to react under the conditions attempted.

A complex pattern of results emerged from the reactions of aniline with cyclic alcohols and diols using the bis(aryl)substituted catalysts (Figure 2). Aliphatic secondary cyclic alcohols cyclopentanol, cyclohexanol, cycloheptanol, and $\beta$ tetralol gave products in good yields, representing a valuable

application of the methodology. However, cyclic or acyclic benzylic/propargylic alcohols including $\alpha$-tetralol, 1-phenylethanol, and 2-hydroxy-4-phenyl-but-3-yne did not give the products of hydrogen borrowing (Figure 2). It is possible that
these alcohols form a stable imine or possibly the enamine upon condensation of the corresponding ketone with aniline, but these intermediates were not isolated from the reactions. The reaction of aniline with diols was also briefly assessed, and

Figure 4. Products formed from the reaction of 4-phenylpiperidine and alcohols using catalyst 1 and a $1: 2$ ratio of amine/alcohol ( $140{ }^{\circ} \mathrm{C}$, xylene, 16h).

Figure 5. Products of the reaction of 3-trifluoromethylbenzyl alcohol with a range of alcohols and diols, using catalyst $\mathbf{1}$ and a $1: 2$ ratio of amine/ alcohol.
products were isolated from the reactions, but in low yields. In the case of 1,5-dihydroxypentane, a product could not be isolated (Figure 2). In the diol reactions, some aminoalcohol was also formed in each case, i.e., from the reaction of only one alcohol in the diol.

The reactions of amines with alcohols containing an unsaturated functionality more distant from the alcohol are capable of forming valuable addition products (Figure 3). Initially, we used our standard conditions, i.e., an excess of amine, which had previously given good results. Unfortunately, for these substrates, the yields were low using the bis(aryl) complexes 5 and $\mathbf{6}$ as catalysts. In contrast, improved results were achieved using the Knölker catalyst precursor $\mathbf{1}$ (Figure 3A). At $140{ }^{\circ} \mathrm{C}$, both alkene- and alkyne-containing products 37 and 38 were formed in $95 \%$ and $80 \%$ isolated yields, respectively, and 37 was also formed in $75 \%$ yield at $120{ }^{\circ} \mathrm{C}$. Successful additions of the pentenyl group were also achieved using $p$-methoxy and $p$-chloro anilines to give 39 and 40, respectively (Figure 3A). As far as we are aware, these represent the first reported examples of $\mathrm{C}-\mathrm{N}$ bond formation under hydrogen borrowing conditions of unsaturated alcohols using an iron-based catalyst. Under these conditions, however, the reaction of the corresponding non-TMS-protected alkyne hex-
$5-\mathrm{yn}-1$-ol did not yield a product, possibly due to an interaction with the terminal alkyne causing catalyst inhibition.

In an extension of this work, we thought it was possible that more basic (i.e., nonaromatic) amines could be inhibiting the iron catalyst; therefore, we reversed the ratio of reagents so that an excess of alcohol was used. This resulted in the successful formation of the desired amine products from the reaction of benzylamine with pentanol (Figure 3B), and products 41-44 containing alkene, alkyne, and aromatic functionality were successfully added to the amine. To expand upon this improved reactivity, the amine/alcohol 1:2 ratio was applied to the hydrogen borrowing reactions of the cyclic basic amine 4phenylpypiperidine, and in the coupling products, 45-53 were formed in good yields from primary and secondary alcohols (Figure 4). 4-Phenylpiperidine, possibly due to its more hydrophobic nature and better solubility in xylene, was found to be more compatible with this application, under the reaction conditions used, than more hydrophilic amines such as piperidine and morpholine, from which products were not isolated.

The revised reaction conditions, coupled to the use of catalyst 1 , permitted further $\mathrm{C}-\mathrm{N}$ bond formation reactions with a benzylic amine (Figure 5). In these examples, 3trifluoromethyl benzylamine was selected as a representative

substituted benzylic amine as this had been reported to give good results in a previous study. ${ }^{7}$ We were able to successfully generate a range of addition products $54-63$ in good yields, including products from reactions with cyclic alcohols, an acyclic secondary alcohol, and diols. In one further example, a longer chain amine, 4-phenylbutylamine, was successfully coupled with benzyl alcohol to form the secondary amine 64.

We also found that tertiary amines 65-68 could be formed from secondary ones using the modified conditions, including the alkylation of N -methyl- N -cyclohexylamine, as illustrated in Figure 6.

A class of alcohol substrates, which continue to be challenging in this application, contain oxygen atoms at a nearby position to the alcohol (Figure 7). The reasons for this

Figure 7. Oxygen-containing alcohols that did not work in this application.
are not immediately clear, although it is possible that the substrate or an intermediate in the reaction inhibits the catalyst by chelation. Studies are ongoing in order to establish a better understanding of this reaction and a potential solution.

## CONCLUSION

A series of novel iron complexes, containing aryl groups flanking the central $\mathrm{C}=\mathrm{O}$ in the cyclopentadienyl ring, were prepared and applied to the catalysis of the formation of $\mathrm{C}-\mathrm{N}$ bond formation of aromatic amines via hydrogen borrowing. For alcohols containing double or triple bonds, the Knölker catalyst 1 was more effective, however, and gave unsaturated products in good yields using anilines as the amine component. For coupling reactions involving basic amines, the reversed 1:2 ratio of amine/alcohol gave improved results, possibly due to reduced inhibition of the catalyst.

## EXPERIMENTAL SECTION

General Experimental Methods. All solvents and reagents were degassed before use, and all reactions were carried out under a nitrogen atmosphere. Reactions were monitored by TLC using aluminum backed silica gel 60 (F254) plates and were visualized using UV 254 nm and phosphomolybdic acid or potassium permanganate dips as appropriate. Flash column chromatography was carried out routinely on silica gel. Reagents were used as received from commercial sources unless otherwise stated. Dry solvents were purchased and used as received. All syntheses of iron complexes and iron catalytic reactions were carried out in ACE 15 Ml 150 psi pressure
tested pressure tubes and heated in aluminum heating blocks. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker DPX ( 400 or 500 MHz ) spectrometer. Chemical shifts were reported in $\delta$ units, parts per million relative to the singlet at 7.26 ppm for chloroform and 0.00 ppm for TMS. Mass spectra for the analysis of synthetic products were recorded on a Bruker Esquire2000 or a Bruker MicroTOF mass spectrometer. Coupling constants ( $J$ ) were measured in hertz ( Hz ). IR spectra were recorded on a PerkinElmer Spectrum One FT-IR Golden Gate. Melting points were recorded on a Stuart Scientific SMP 1 instrument and were uncorrected.
General Procedure for Aniline-Related "Hydrogen Borrowing" Reactions. Tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro-2H-inden-2-one) iron ( $5,43.0 \mathrm{mg}, 0.100 \mathrm{mmol}$, 0.1 equiv) was placed in a thoroughly dried 15 mL pressure tube with a stir bar, and xylene ( 0.5 mL ) was added. Distilled aniline ( $137 \mu \mathrm{~L}, 139 \mathrm{mg}, 1.5$ equiv) and alcohol ( $1.00 \mathrm{mmol}, 1$ equiv) were added with stirring. The pressure tube was sealed with a septum and degassed through a nitrogen bubbler for 15 min . Trimethylamine $N$-oxide ( $7.00 \mathrm{mg}, 0.09 \mathrm{mmol}$, 0.09 equiv) was then added with stirring, and the solution was further degassed for 5 min before being sealed with a pressure tube lid and stirred at $140^{\circ} \mathrm{C}$ for 16 h . The tube was then allowed to cool to room temperature, and its contents were passed through Celite with ethyl acetate. Solvent removal via a rotary evaporator gave the product as a dark brown residue, which was purified as indicated in each case.

General Procedure for Sonogashira Reactions. In a dried and degassed 100 mL round-bottom flask, 1,7 -octadiyne ( 1.00 g , 9.42 $\mathrm{mmol}, 1.0$ equiv) and aryl iodide ( $20.7 \mathrm{mmol}, 2.2$ equiv) were dissolved in anhydrous THF ( 34 mL ) with stirring. $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ ( $50.0 \mathrm{mg}, 0.0712 \mathrm{mmol}, 0.03$ equiv) and $\mathrm{CuI}(27.0 \mathrm{mg}, 0.142 \mathrm{mmol}$, 0.06 equiv) were added to the stirred solution to give a yellow suspension. ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}(13.2 \mathrm{~mL}, 9.53 \mathrm{~g}, 10$ equiv) was added, and a thick precipitate formed. Vigorous stirring overnight was followed by filtration through Celite with ethyl acetate. This served to remove precipitates and metal impurities and gave the product as a brown residue after solvent removal via a rotary evaporator. The products were purified as indicated.

1,8-Diphenylocta-1,7-diyne (10). ${ }^{156}$ 1,7-Octadiyne ( $1.00 \mathrm{~g}, 9.42$ $\mathrm{mmol})$ was added to a stirred solution of iodobenzene $(4.23 \mathrm{~g}, 20.7$ $\mathrm{mmol})$ in dry THF ( 34 mL ). $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(50.0 \mathrm{mg}, 0.071 \mathrm{mmol})$, $\mathrm{CuI}(27.0 \mathrm{mg}, 0.141 \mathrm{mmol})$, and ${ }^{2} \mathrm{Pr}_{2} \mathrm{NH}(9.53 \mathrm{~g}, 94.2 \mathrm{mmol})$ were added, and the reaction was stirred at room temperature overnight. The reaction solidified and was therefore passed through a Celite/silica plug with $20 \%$ ethyl acetate/pentane to give a brown oil after solvent removal under reduced pressure. Recrystallization from methanol gave the product as a white solid ( $2.19 \mathrm{~g}, 8.49 \mathrm{mmol}, 90.1 \%$ ): ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.40(4 \mathrm{H}, \mathrm{d}, J=4.0 \mathrm{~Hz}, \mathrm{ArH}), 7.25-7.29(6 \mathrm{H}$, $\mathrm{m}, \mathrm{ArH}), 2.48\left(4 \mathrm{H}, \mathrm{br}\right.$ s, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.79(4 \mathrm{H}, \mathrm{br}$ s, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ) ppm.

Tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro-2H-inden-2-one)iron (5). ${ }^{146} 1,8$-Diphenylocta-1,7-diyne ( $0.500 \mathrm{~g}, 1.94 \mathrm{mmol}$ ) was placed in a dried pressure tube with a stir bar with dry toluene ( 5.00 mL ), and $\mathrm{Fe}(\mathrm{CO})_{5}(786 \mu \mathrm{~L}, 1.14 \mathrm{~g}, 5.82 \mathrm{mmol})$ was added. The reaction solution was degassed thoroughly with $\mathrm{N}_{2}$ for 15 min . The tube was sealed and heated to $130^{\circ} \mathrm{C}$ overnight. The tube was then allowed to cool to room temperature, and tube contents were passed through a silica plug with 50:50 EtOAc/pentane. The solvent was then removed under reduced pressure to give 5 as a brown solid ( $0.729 \mathrm{~g}, 1.71 \mathrm{mmol}$, $87.9 \%$ ): mp $164-165{ }^{\circ} \mathrm{C}$ (lit. mp 165-166 ${ }^{\circ} \mathrm{C}$ ); IR $\nu_{\text {max }} 3062$, 2950,

2864, 1641, $1627 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.74(4 \mathrm{H}, \mathrm{d}, \mathrm{J}$ $=7.2 \mathrm{~Hz}, \mathrm{ArH}), 7.26-7.47(6 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 2.64-2.89\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, $1.94\left(4 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 209.0$, 169.5, 22.3, 131.3, 129.7, 128.4, 127.9, 100.4, 81.9, 23.7 ppm ; MS (ESI) $m / z 427[\mathrm{M}+\mathrm{H}]^{+}, 449[\mathrm{M}+\mathrm{Na}]^{+}$.

1,8-Bis(4-methoxyphenyl)octa-1,7-diyne (11). 1,8-Bis(4-methoxyphenyl)octa-1,7-diyne was prepared via the same method as 1,8-diphenylocta-1,7-diyne with 1,7 -octadiyne ( $750 \mathrm{mg}, 7.07 \mathrm{mmol}$ ), 4-iodoanisole ( $3.31 \mathrm{~g}, 14.1 \mathrm{mmol}$ ), $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(74.0 \mathrm{mg}, 0.106$ $\mathrm{mmol}), \mathrm{CuI}(40.0 \mathrm{mg}, 0.212 \mathrm{mmol})$, and ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}(7.15 \mathrm{~g}, 70.6 \mathrm{mmol})$ to give 1,8-bis(4-methoxyphenyl)octa-1,7-diyne as a white solid ( $1.77 \mathrm{~g}, 5.56 \mathrm{mmol}, 78.7 \%$ ): mp $39-40^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{O}_{2}$ 319.1693, found 319.1694; IR $\nu_{\max }$ 2998, 2937, 1605, $1568 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.33(4 \mathrm{H}, \mathrm{d}, J$ $=8.8 \mathrm{~Hz}, \mathrm{ArH}), 6.81(4 \mathrm{H}, \mathrm{d}, J=8.8 \mathrm{~Hz}, \mathrm{ArH}), 3.79\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 2.34-2.37 ( $4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 1.73-1.77 (4H, m, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 159.0$, 132.9, 116.9, 113.8, 88.2, 80.6, 55.3, 28.0, 19.0 ppm ; MS (ESI) $\mathrm{m} / \mathrm{z}$ $319[\mathrm{M}+\mathrm{H}]^{+}$.

Tricarbonyl(1,3-di(4-methoxyphenyl)-4,5,6,7-tetrahydro-2H-inden-2-one)iron (6). Tricarbonyl(1,3-di(4-methoxyphenyl)-4,5,6,7-tetrahydro- 2 H -inden-2-one)iron was prepared via the same procedure as was used for tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro- 2 H -inden2 -one)iron. In an oven-dried pressure tube, 1,8 -bis(4-methoxyphenyl)-octa-1,7-diyne ( $500 \mathrm{mg}, 1.57 \mathrm{mmol}$ ) was placed in dry toluene ( 5.00 $\mathrm{mL})$ with $\mathrm{Fe}(\mathrm{CO})_{5}(637 \mu \mathrm{~L}, 4.72 \mathrm{mmol})$, and the solution was vigorously degassed with a $\mathrm{N}_{2}$ line for 15 min . The tube was then sealed and heated with stirring to $130{ }^{\circ} \mathrm{C}$ overnight. Complex 6 was isolated as a brown solid ( $726 \mathrm{mg}, 1.49 \mathrm{mmol}, 94.8 \%$ ): mp 166-167 ${ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{26} \mathrm{H}_{23} \mathrm{FeO}_{6}$ 487.0839, found 487.0842; IR $\nu_{\max }$ 2941, 2054, $1618 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.73(4 \mathrm{H}, \mathrm{d}, J=10.0 \mathrm{~Hz}, \mathrm{ArH}), 6.91(4 \mathrm{H}$, d, $J=10.0 \mathrm{~Hz}, \mathrm{ArH}), 3.82\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.84-2.82\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, $1.92\left(4 \mathrm{H}\right.$, br s, $\left.\mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 209.3, 169.3, 159.1, 130.8, 121.9, 113.9, 99.70, 81.9, 55.3, 23.9, 22.3 ppm ; MS (ESI) $m / z 487[\mathrm{M}+\mathrm{H}]^{+}, 509[\mathrm{M}+\mathrm{Na}]^{+}$.

1,8-Bis(3,4,5-trimethoxybenzene)octa-1,7-diyne (12). In a dried and degassed $\left(\mathrm{N}_{2}\right) 100 \mathrm{~mL}$ round-bottomed flask equipped with a Findenser, 1,7 -octadiyne ( $1.00 \mathrm{~g}, 9.42 \mathrm{mmol}$ ) and 5-bromo-1,2,3trimethoxybenzene $(5.121 \mathrm{~g}, 20.7 \mathrm{mmol})$ were placed in triethylamine $(25 \mathrm{~mL})$ with stirring via a magnetic stir bar. $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(100 \mathrm{mg}$, $0.142 \mathrm{mmol})$ and $\mathrm{CuI}(26 \mathrm{mg}, 0.137 \mathrm{mmol})$ were added, and the reaction was stirred at $50{ }^{\circ} \mathrm{C}$ for 2 days. The reaction mixture was purified via column chromatography eluted with $0-50 \%$ ethyl acetate in pentane to give the product as a white crystalline solid ( 0.507 g , $1.16 \mathrm{mmol}, 12.3 \%): \mathrm{mp} 51-52{ }^{\circ} \mathrm{C}$; IR $\nu_{\max } 2956,2918,1621 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.64(4 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.84(18 \mathrm{H}, \mathrm{s}, \mathrm{ArOMe})$, 2.45-2.49 (4H, m, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.77-1.81(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 153.0, 138.2, 119.0, 108.6, 88.9, 80.9, 60.9, 56.1, 27.9, 19.0 ppm ; MS (ESI) $m / z 461[\mathrm{M}+\mathrm{H}]^{+}$.

Tricarbonyl(1,3-di(3,4,5-trimethoxyphenyl)-4,5,6,7-tetrahydro$2 H$-inden-2-one)iron (7). Tricarbonyl(1,3-di(3,4,5-trimethoxyphenyl)-4,5,6,7-tetrahydro- 2 H -inden-2-one)iron was synthesized via the same procedure as was used for tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro2 H -inden-2-one)iron, using 1,8-bis(3,4,5-trimethoxybenzene) octa-1,7diyne $(0.400 \mathrm{~g}, 0.913 \mathrm{mmol})$ and $\mathrm{Fe}(\mathrm{CO})_{5}(537 \mu \mathrm{~L}, 800 \mathrm{mg}, 2.74$ mmol ) in toluene $(5 \mathrm{~mL})$ to give 7 as a yellow solid ( $0.454 \mathrm{mg}, 0.897$ mmol, $98.2 \%$ ): mp $167-168{ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$ calcd for $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{FeNaO}_{10}$ 629.1081, found 629.1079; IR $\nu_{\max }$ 2941, 2837, $1619 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.03(4 \mathrm{H}, \mathrm{s}, \mathrm{ArH})$, $3.88(18 \mathrm{H}, \mathrm{s}, \mathrm{ArOMe}), 2.82-2.91\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.69-2.79(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.94-1.92\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 209.2, 169.6, 152.9, 137.9, 126.6, 107.0, 99.9, 82.1, 60.8, 56.1, 23.9, 22.3 ppm ; MS (ESI) $\mathrm{m} / \mathrm{z} 629[\mathrm{M}+\mathrm{Na}]^{+}$.

1,8-(4-Chlorophenyl)octa-1,7-diyne (13). 1,8-(4-Chlorophenyl)-octa-1,7-diyne was synthesized through the same method as for the synthesis of 1,8 -diphenylocta-1,7-diyne, using 1,7-octadiyne ( 0.300 g , $2.83 \mathrm{mmol})$, 1-chloro-4-iodobenzene $(1.49 \mathrm{~g}, 6.23 \mathrm{mmol})$, $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(30.0 \mathrm{mg}, 0.0425 \mathrm{mmol})$, $\mathrm{CuI}(16.0 \mathrm{mg}, 0.0850$
$\mathrm{mmol})$, and ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}(3.97 \mathrm{~mL}, 2.86 \mathrm{~g}, 28.3 \mathrm{mmol})$. The reaction was performed at room temperature overnight, and the reaction mixture was passed through a Celite silica plug with 20:80 ethyl acetate/ pentane. Subsequent column chromatography eluted with $0-20 \%$ ethyl acetate in pentane gave the product as a white solid $(0.759 \mathrm{~g}$, $2.32 \mathrm{mmol}, 82.2 \%$ ): $\mathrm{mp} 42-43{ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+$ $\mathrm{Ag}]^{+}$calcd for $\mathrm{C}_{20} \mathrm{H}_{16} \mathrm{AgCl}_{2}$ 434.9668, found 434.9655; IR $\nu_{\text {max }}$ 2942, 2871, 2769, $1624 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.30(4 \mathrm{H}, \mathrm{d}, J$ $=10.0 \mathrm{~Hz}, \operatorname{Ar} H), 7.23(4 \mathrm{H}, \mathrm{d}, J=10.0 \mathrm{~Hz}, \mathrm{Ar} H), 2.46-2.42(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CCAr}\right), 1.75\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 134.6,133.1,128.6,122.5,90.9,80.0,27.8,19.1$ ppm ; MS (ESI) $m / z 435[\mathrm{M}+\mathrm{Ag}]^{+}$.

Tricarbonyl(1,3-di(4-chloro)phenyl-4,5,6,7-tetrahydro-2H-inden-2-one)iron (8). Tricarbonyl(1,3-di(4-chloro)phenyl-4,5,6,7-tetrahydro2 H -inden-2-one)iron was prepared via the same method used previously to prepare tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro-2H-inden-2-one)iron, using 1,8-bis(4-chlorophenyl)octa-1,7-diyne $(0.500 \mathrm{~g}, 1.53 \mathrm{mmol})$ and $\mathrm{Fe}(\mathrm{CO})_{5}(620 \mu \mathrm{~L}, 4.59 \mathrm{mmol})$ in dry toluene $(5.00 \mathrm{~mL})$ at $130{ }^{\circ} \mathrm{C}$ overnight to give 8 as a brown solid ( $0.708 \mathrm{~g}, 1.43 \mathrm{mmol}, 93.8 \%$ ): mp 152-153 ${ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} /$ $z[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{24} \mathrm{H}_{17} \mathrm{Cl}_{2} \mathrm{FeO} 494.9848$, found 494.9855; IR $\nu_{\max }$ 2062, 2013, 1625, $1606 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.74(4 \mathrm{H}, \mathrm{d}, \mathrm{ArH}), 7.38(4 \mathrm{H}, \mathrm{d}, \mathrm{ArH}), 2.37-3.04(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.96\left(4 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 214.6,208.6,169.0,133.9,130.8,129.9$, 128.7, 100.2, 80.3, 23.8, 22.2 ppm ; MS (ESI) $\mathrm{m} / \mathrm{z} 495[\mathrm{M}+\mathrm{H}]^{+}$.

1,8-Bis(4-nitrophenyl)octa-1,7-diyne (14). 1,8-Bis(4-nitrophenyl)-octa-1,7-diyne was synthesized through the same procedure as used previously for 1,8 -diphenylocta-1,7-diyne, using 1,7-octadiyne (300 $\mathrm{mg}, 2.83 \mathrm{mmol})$, 1-iodo-4-nitrobenzene ( $1.551 \mathrm{~g}, 6.23 \mathrm{mmol}$ ), $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(50.0 \mathrm{mg}, 0.0707 \mathrm{mmol}), \mathrm{CuI}(27.0 \mathrm{mg}, 0.141$ $\mathrm{mmol})$, and ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}(6.60 \mathrm{~mL}, 4.77 \mathrm{~g}, 47.1 \mathrm{mmol})$ to give $1,8-\mathrm{bis}(4-$ nitrophenyl) octa-1,7-diyne as an orange solid $(0.339 \mathrm{~g}, 0.974 \mathrm{mmol}$, $34.4 \%$ ): mp $40-42{ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]+$ calcd for $\mathrm{C}_{20} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{NaO}_{4} 371.1002$, found 371.1001; IR $\nu_{\max } 2931,1590 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.16(4 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}, \mathrm{ArH}), 7.52$ $(4 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.0 \mathrm{~Hz}, \mathrm{ArH}), 2.54\left(4 \mathrm{H}, \mathrm{br} s, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.82(4 \mathrm{H}$, br s, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ) ppm; ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 146.7, 132.3, 130.7, 123.5, 95.8, 79.8, 27.6, 19.2 ppm; MS (ESI) m/z 349 [M $+\mathrm{H}]^{+}$.

1,8-Bis(4-(trifluoromethyl)phenyl)octa-1,7-diyne (15). 1,8-Bis(4-(trifluoromethyl)phenyl)octa-1,7-diyne was synthesized through the same procedure as previously used to synthesize 1,8 -diphenylocta-1,7diyne, with 1,7 -octadiyne $(375 \mu \mathrm{~L}, 300 \mathrm{mg}, 2.83 \mathrm{mmol})$, 4iodobenzotrifluoride $(916 \mu \mathrm{~L}, 1.70 \mathrm{~g} 6.23 \mathrm{mmol}), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ $(30.0 \mathrm{mg}, 0.0425 \mathrm{mmol}), \mathrm{CuI}(16.0 \mathrm{mg}, 0.0850 \mathrm{mmol})$, and ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}$ ( $3.97 \mathrm{~mL}, 2.86 \mathrm{~g}, 28.3 \mathrm{mmol}$ ) to give 1,8 -bis(4-(trifluoromethyl)-phenyl)octa-1,7-diyne as a white solid after column chromatography eluted with $0-20 \%$ ethyl acetate in hexane $(0.780 \mathrm{~g}, 1.98 \mathrm{mmol}$, 69.6\%): mp 35-36 ${ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Ag}]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{16} \mathrm{AgF}_{6}$ 501.0202, found 501.0212; IR $\nu_{\max }$ 2073, 2023, 1995 $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.51-7.59(4 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}$, $\mathrm{ArH}), 7.43-7.51(4 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}, \mathrm{ArH}), 2.13-2.80(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.59-1.95\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 131.8,129.4,127.8(J=32 \mathrm{~Hz}), 125.2$, $123.7(J=230 \mathrm{~Hz}), 92.5,79.9,27.7,19.0 \mathrm{ppm}$; MS (ESI) $\mathrm{m} / \mathrm{z} 501$ ( $[\mathrm{M}+\mathrm{Ag}], 100 \%$ ).

Tricarbonyl(1,3-di(4-trifluoromethylphenyl)-4,5,6,7-tetrahydro-2H-inden-2-one)iron (16). Tricarbonyl(1,3-di(4-trifluoromethylphen-$\mathrm{yl})-4,5,6,7$-tetrahydro- 2 H -inden-2-one)iron was synthesized via the procedure previously used to prepare tricarbonyl(1,3-diphenyl-4,5,6,7-tetrahydro- 2 H -inden-2-one)iron, using 1,8-bis(4-(trifluoromethyl)-phenyl)octa-1,7-diyne $(500 \mathrm{mg}, 1.27 \mathrm{mmol})$ and $\mathrm{Fe}(\mathrm{CO})_{5}(513 \mu \mathrm{~L}$, 3.81 mmol ) in toluene $(5 \mathrm{~mL})$ to give 10 as a brown solid ( 690 mg , $1.23 \mathrm{mmol}, 97 \%$ ): mp $155-156{ }^{\circ} \mathrm{C}$; HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+$ $\mathrm{Na}]+$ calcd for $\mathrm{C}_{26} \mathrm{H}_{16} \mathrm{~F}_{6} \mathrm{FeNaO}_{4}$ 585.0195, found 585.0196; IR $\nu_{\text {max }}$ 2943, 2070, $1640 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.93(4 \mathrm{H}, \mathrm{m}, J$ $=10.0 \mathrm{~Hz}, \mathrm{ArH}), 7.64-7.60(4 \mathrm{H}, \mathrm{m}, J=10.0 \mathrm{~Hz}, \mathrm{ArH}), 2.79(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.98\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$

$N$-Methyl- $N$-(pent-4-en-1-yl)cyclohexanamine (67). N-Methyl-N-(pent-4-en-1-yl)cyclohexanamine was synthesized from $N$-methylcyclohexylamine $(130 \mu \mathrm{~L}, 113 \mathrm{mg}, 1.00 \mathrm{mmol})$, 4-penten-1-ol $(208 \mu \mathrm{~L}$, $172 \mathrm{mg}, 2.00 \mathrm{mmol})$, tricarbonyl(1,3-di(trimethylsilyl)-4,5,6,7-tetrahy-dro- 2 H -inden-2-one) iron ( $42.0 \mathrm{mg}, 0.100 \mathrm{mmol}$ ), and trimethylamine $N$-oxide ( $15.0 \mathrm{mg}, 0.2 \mathrm{mmol}$ ). The purification of the compound was completed via column chromatography eluted with $0-40 \%$ ethyl acetate in pentane to give N -methylcyclohexylamine as a colorless oil ( $163 \mathrm{mg}, 0.884 \mathrm{mmol}, 88.4 \%$ ): HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]^{+}$ calcd for $\mathrm{C}_{12} \mathrm{H}_{24} \mathrm{~N}$ 182.1903, found 182.1905; IR $\nu_{\max }$ 2926, 2853, $2789,1640 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.83(1 \mathrm{H}, \mathrm{ddt}, J=$ $\left.17.0,10.3,6.6 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CH}_{2}\right), 5.02\left(1 \mathrm{H}, \mathrm{dd}, J=17.1,1.9 \mathrm{~Hz}, \mathrm{CH}_{2}=\right.$ $\mathrm{CH}), 4.95\left(1 \mathrm{H}, \mathrm{d}, J=10.1 \mathrm{~Hz}, \mathrm{CH}_{2}=\mathrm{CH}\right), 2.40-2.46(2 \mathrm{H}, \mathrm{m}), 2.31-$ $2.39(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}), 2.24\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}\right), 2.05(2 \mathrm{H}, \mathrm{q}, J=6.9 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ chain), $1.78\left(4 \mathrm{H}, \mathrm{d}, J=9.5 \mathrm{~Hz}, \mathrm{CH}_{2}\right.$ ring $), 1.62(1 \mathrm{H}, \mathrm{d}, J$ $=12.7 \mathrm{~Hz}, \mathrm{CH}), 1.55\left(2 \mathrm{H}\right.$, quin, $J=7.6 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ chain $)$, $1.14-1.28\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.09(1 \mathrm{H}, \mathrm{td}, J=12.3,3.4 \mathrm{~Hz}, \mathrm{PhCH}) \mathrm{ppm}$; ${ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 138.8,114.4,62.6,53.2,37.9,31.8$, 28.6, 27.2, 26.4, 26.1 ppm ; MS (ESI) $\mathrm{m} / \mathrm{z} 182$ ([M + H], 100\%).

N-Allyl-N-(3-(4-methoxyphenyl)propyl)prop-2-en-1-amine (68). $N$-Allyl-N-(3-(4-methoxyphenyl)propyl)prop-2-en-1-amine was synthesized via the general procedure using diallylamine ( $123 \mu \mathrm{~L}, 97$ $\mathrm{mg}, 1.00 \mathrm{mmol}$ ), 3-(4-methoxyphenyl)-1-propanol (332 mg, 2.00 $\mathrm{mmol})$, tricarbonyl(1,3-di(trimethylsilyl)-4,5,6,7-tetrahydro-2H-inden2 -one) iron ( $42.0 \mathrm{mg}, 0.100 \mathrm{mmol}$ ), and trimethylamine N -oxide ( 15.0 $\mathrm{mg}, 0.2 \mathrm{mmol})$. The product was isolated using column chromatography eluted with $0-20 \%$ ethyl acetate in pentane to give $N$-allyl- $N$-(3-(4-methoxyphenyl)propyl)prop-2-en-1-amine as a colorless oil (228 $\mathrm{mg}, 0.931 \mathrm{mmol}, 93.1 \%)$ : HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{NO}$ 246.1852, found 246.1852; IR $\nu_{\text {max }}$ 2945, 2866, $1636 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.09(2 \mathrm{H}, \mathrm{d}, J=8.5 \mathrm{~Hz}, \mathrm{ArH}), 6.82$ $(2 \mathrm{H}, \mathrm{d}, J=8.5 \mathrm{~Hz}, \mathrm{ArH}), 5.85(2 \mathrm{H}, \mathrm{ddt}, J=17.0,10.3,6.5 \mathrm{~Hz}$, $\left.\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 5.09-5.19\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CH}_{2}\right), 3.78(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe})$, $3.08\left(2 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, \mathrm{NCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 2.54(2 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz}$, $\left.\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.46\left(2 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 1.75(2 \mathrm{H}$, quin, $\left.J=7.7 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 157.7, 135.8, 134.5, 129.2, 117.3, 113.7, 56.8, 55.3, 52.9, 32.8, 29.0 ppm ; MS (ESI) $m / z 246\left(\left[\mathrm{M}+\mathrm{H}^{+}\right], 100 \%\right)$.
